Driven by a vision to help our clients navigate AI era with clarity and confidence.

Dear friends and partners, at Profico, we are driven by a vision to offer a premium experience in designing and developing next-generation digital solutions.

Alongside our end-to-end product development services, Profico is increasingly focused on AI transformation. For us, this means much more than simply introducing a few new tools. It is a fundamental shift already taking place across three interconnected areas.

First, we are building advanced AI capabilities into the products and solutions we create for our clients.

Second, we are embedding AI into our own operations to work faster, deliver higher quality, and operate more efficiently - while helping our clients apply the same kind of AI-powered automation to their processes. Third, and most fundamentally, we are transforming the way software itself is created.

Bespoke digital solutions regardless of the industry

Capitalize on digital opportunities by utilising our end-to-end expertise in creating and scaling digital solutions of any complexity.

[01]

Custom software development

Custom mobile apps and complex web platforms tailored to complement and empower your business model. End-to-end strategy, design, and development services.

[02]

Applied AI

Integration of AI tools and models into scalable custom software solutions for diverse business applications, from internal process optimisation to enhanced customer-facing services.

[03]

Digital transformation

End-to-end strategic overhaul of business operations through digitalization, from conceptual strategy to pragmatic execution and scaling, creating new value generation avenues.

[04]

Data analytics & business intelligence

Transforming data into actionable insights with advanced analytics tools, empowering businesses to make data-driven decisions.

Embed AI where it compounds value fastest

Unlock the power of AI with our comprehensive suite of services, designed to create and scale intelligent solutions tailored to your unique business needs.

[01]

Agentic workflows

Multi-step task automation that plans, calls tools/APIs, verifies outputs, closes the loop and harnesses human aware safeguards.

[02]

Intelligent search & RAG

Citations, metadata filters, and process automation with auditable states and clear affordances.

[03]

Decision copilots

Natural language interfaces that summarize, compare, explain patterns, classify, extract, and route with clear pricing and SLAs.

[04]

Predictive & optimization models

AI UX for end users with predictive analytics and optimization that delivers measurable business impact.

Evolve your AI needs into a disciplined framework for growth.

We provide end-to-end AI transformation services with the expertise needed to turn your roadmap into a suite of high-performing, intelligent applications.

Partnering with Profico

Profico collaborations are built on transparency. Here's what to expect before and during your project.

Before the offer

- 01 Gathering project information and detailed scope form key stakeholders
- 02 Discussing budgets and setting general timelines
- 03 Introduction to Profico C-suite and our porcesses

Offer & legal documents

- 01 Offer with detailed services and pricing breakdown
- 02 Additional references and resources sent per request
- 03 Drafting and signing of contracts and other legal documents

Discovery and set up

- 01 Creating short and long term project timelines
- 02 Detailed project discovery. May include workshops & Design Sprints.
- 03 Creating stakeholder to team Slack channel and performing team introduction

Production & collaboration

- 01 Agile work methodology with Incremental deliverables and robust QA
- 02 Regular work reviews with stakeholders and PM/team, feedback sessions with Profico C-suite
- 03 Open possibility of project scaling

Profico Network

Profico.Network is a pool of verified external vendors that helps us deliver more value for our partners.

01 Seamless scalability

Instant access to over 40 highly skilled professionals

02 Uncompromising quality

All of our vendors go through a comprehensive vetting process

03 Flexible tech stack

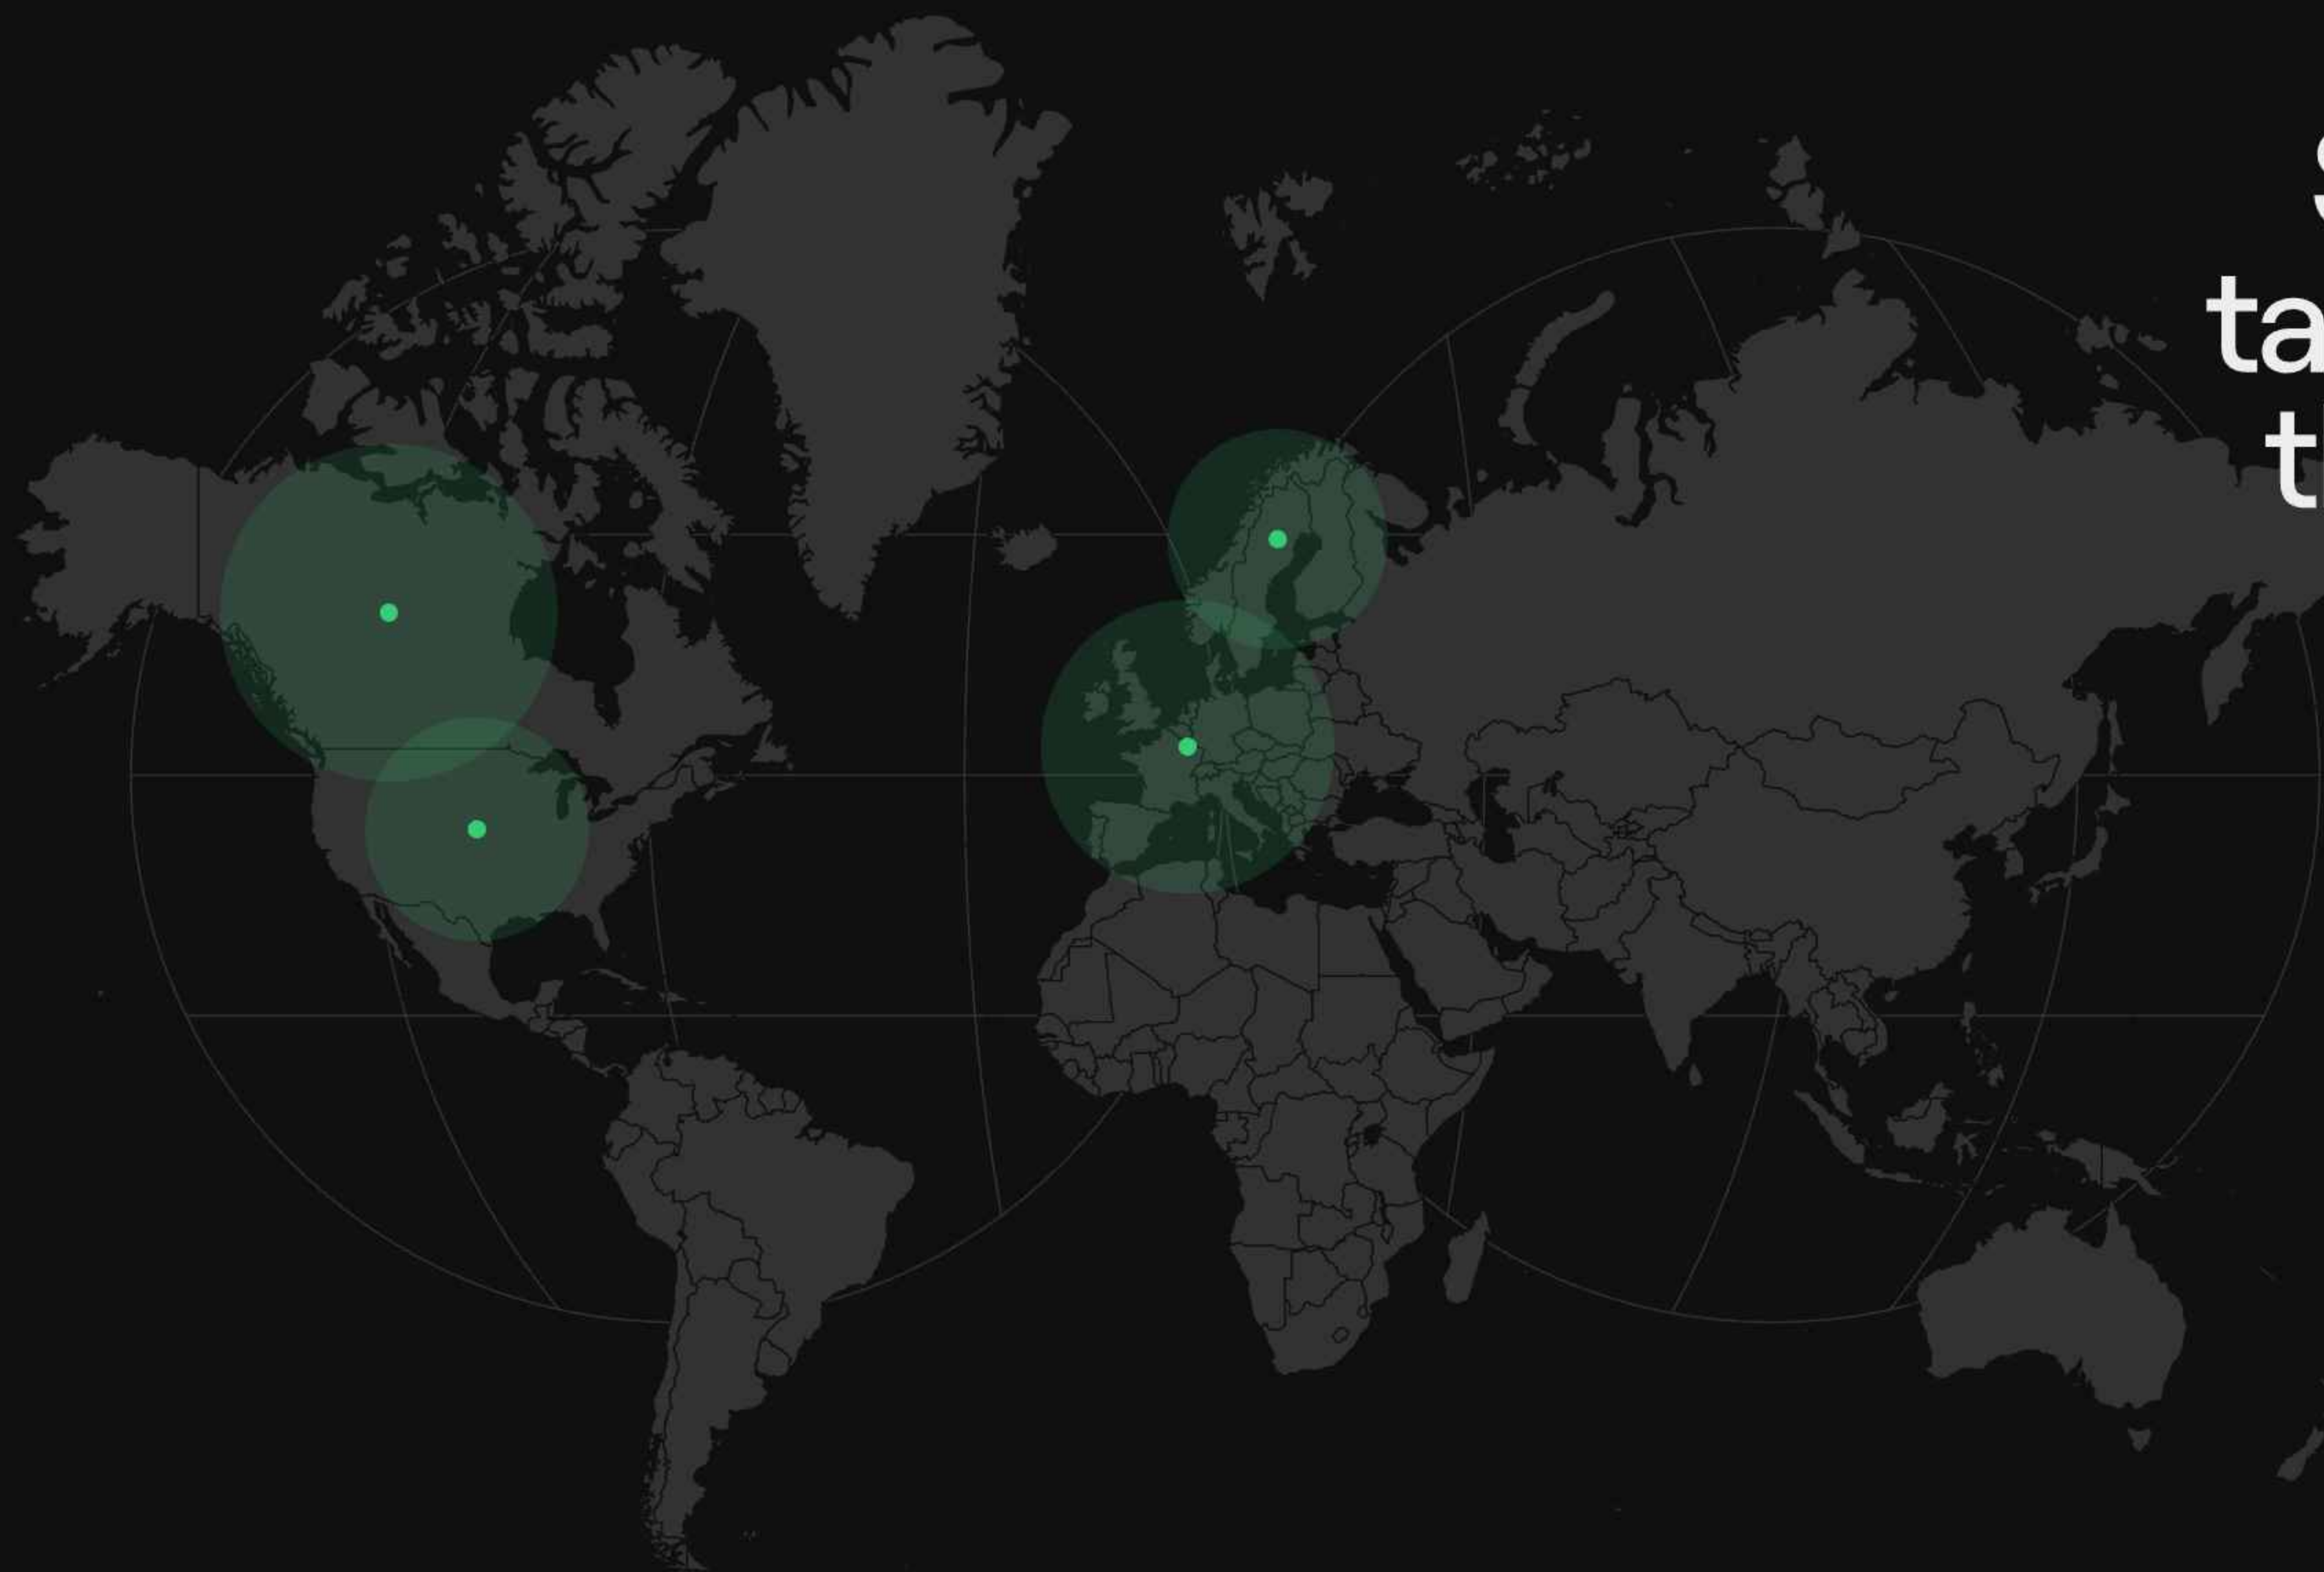

Profico.Network covers the majority of tech stacks used in mobile and web development

04 Consistent excellence

Uniform standards set by Profico ensure high quality and reliability of output

Solutions

AI-powered evolution for a financial news and market monitoring platform

After completing Finansavisen's digital transformation, we built and continue to expand a rich online platform for this leading Norwegian financial news and market monitoring platform. Building on this foundation, we developed a custom content management system that acts as an AI co-pilot for journalists, accelerating research, writing, and content refinement.

INDUSTRY

Online media

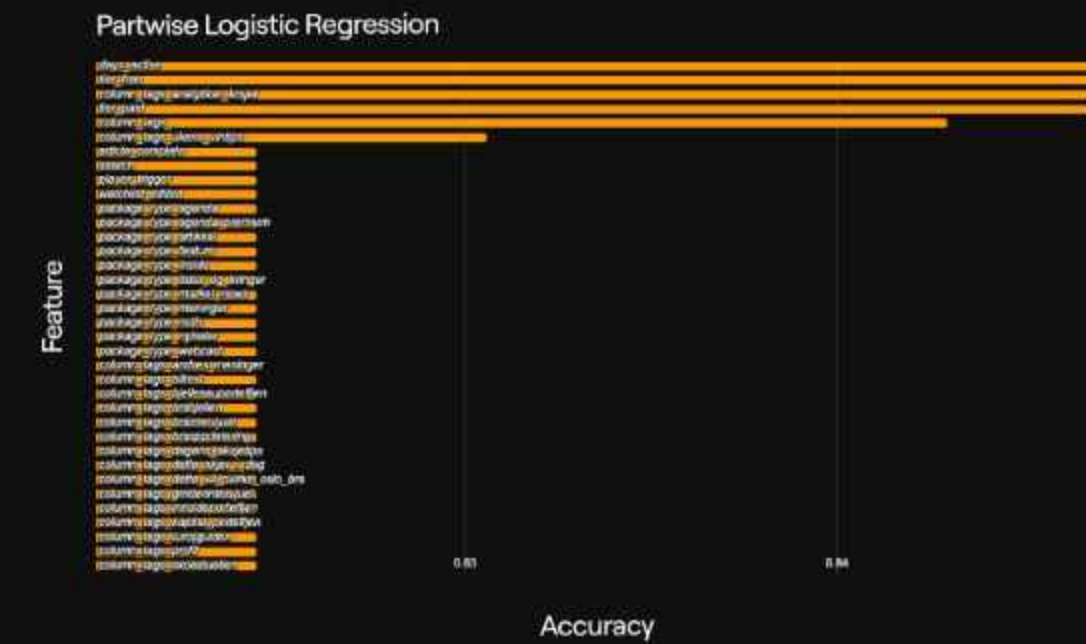

ENGAGEMENT

Standalone product team

The screenshot displays the Finansavisen website interface. At the top, there's a navigation bar with links for 'Nyheter', 'Børs', 'Forum', and 'TV'. Below this, a market ticker shows various indices like Oslo Børs, Brent spot, US Dollar, and EUR. The main headline is 'NÅ: Stort innsidesalg-fallet tiltar i ESG-aksje' (Now: A large insider sale-fall is tilting in ESG shares). The article features a photo of a man in a suit and a red boat. To the right, a sidebar titled 'Siste nytt' (Latest news) lists several articles with timestamps and categories like 'ARBEIDSLIV' (Work life), 'POLITIKK' (Politics), and 'BØRSOPPDATERING' (Market update). Below the main article, there's a section titled 'Is America getting less dynamic, less global?' with a photo of a man in a suit. The bottom of the page shows a large image of a blue car (Tesla Model S) and a headline 'Ser du på nybilsalget i' (Are you watching the new car sale in).

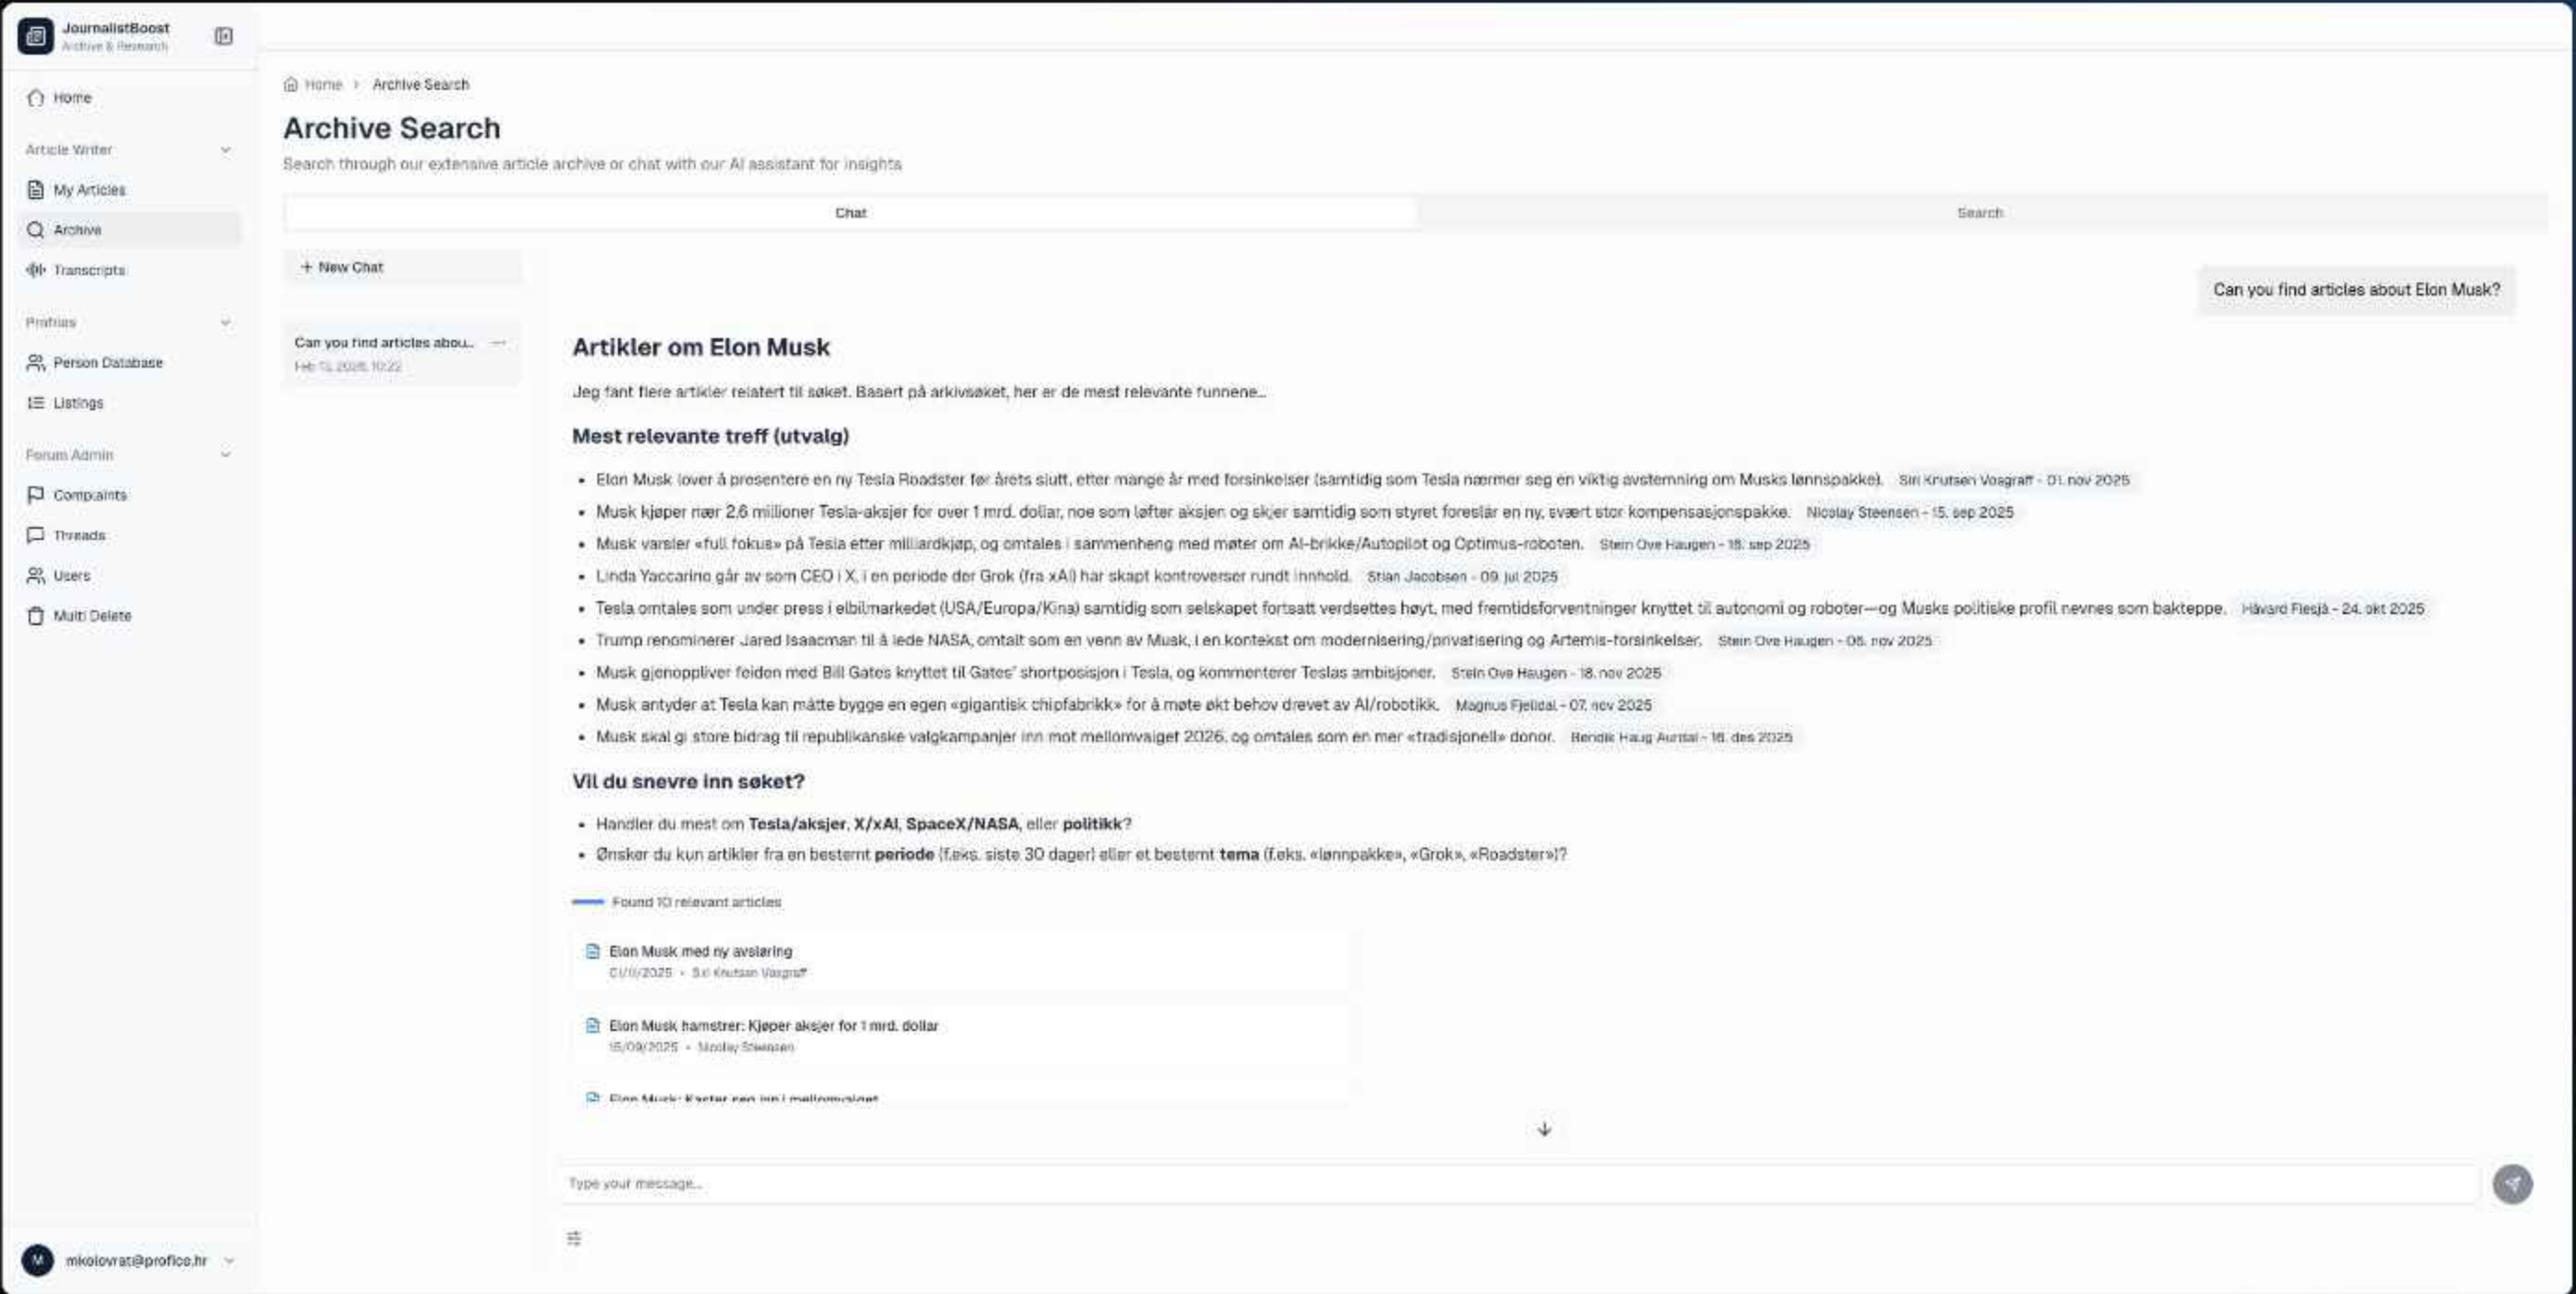

We built an AI model for Finansavisen that flags subscribers likely to cancel one of services by detecting subtle changes in their activity. This allows for automated retention campaigns and helps the newsroom align editorial focus with what keeps users subscribed, turning potential exits into long-term loyalty.

METHOD	ACCURACY
Logistic regression model with user data	80%
Trees model with user data	81%
Logistic regression model with event + user data	84%
Trees model with event + user data	86%

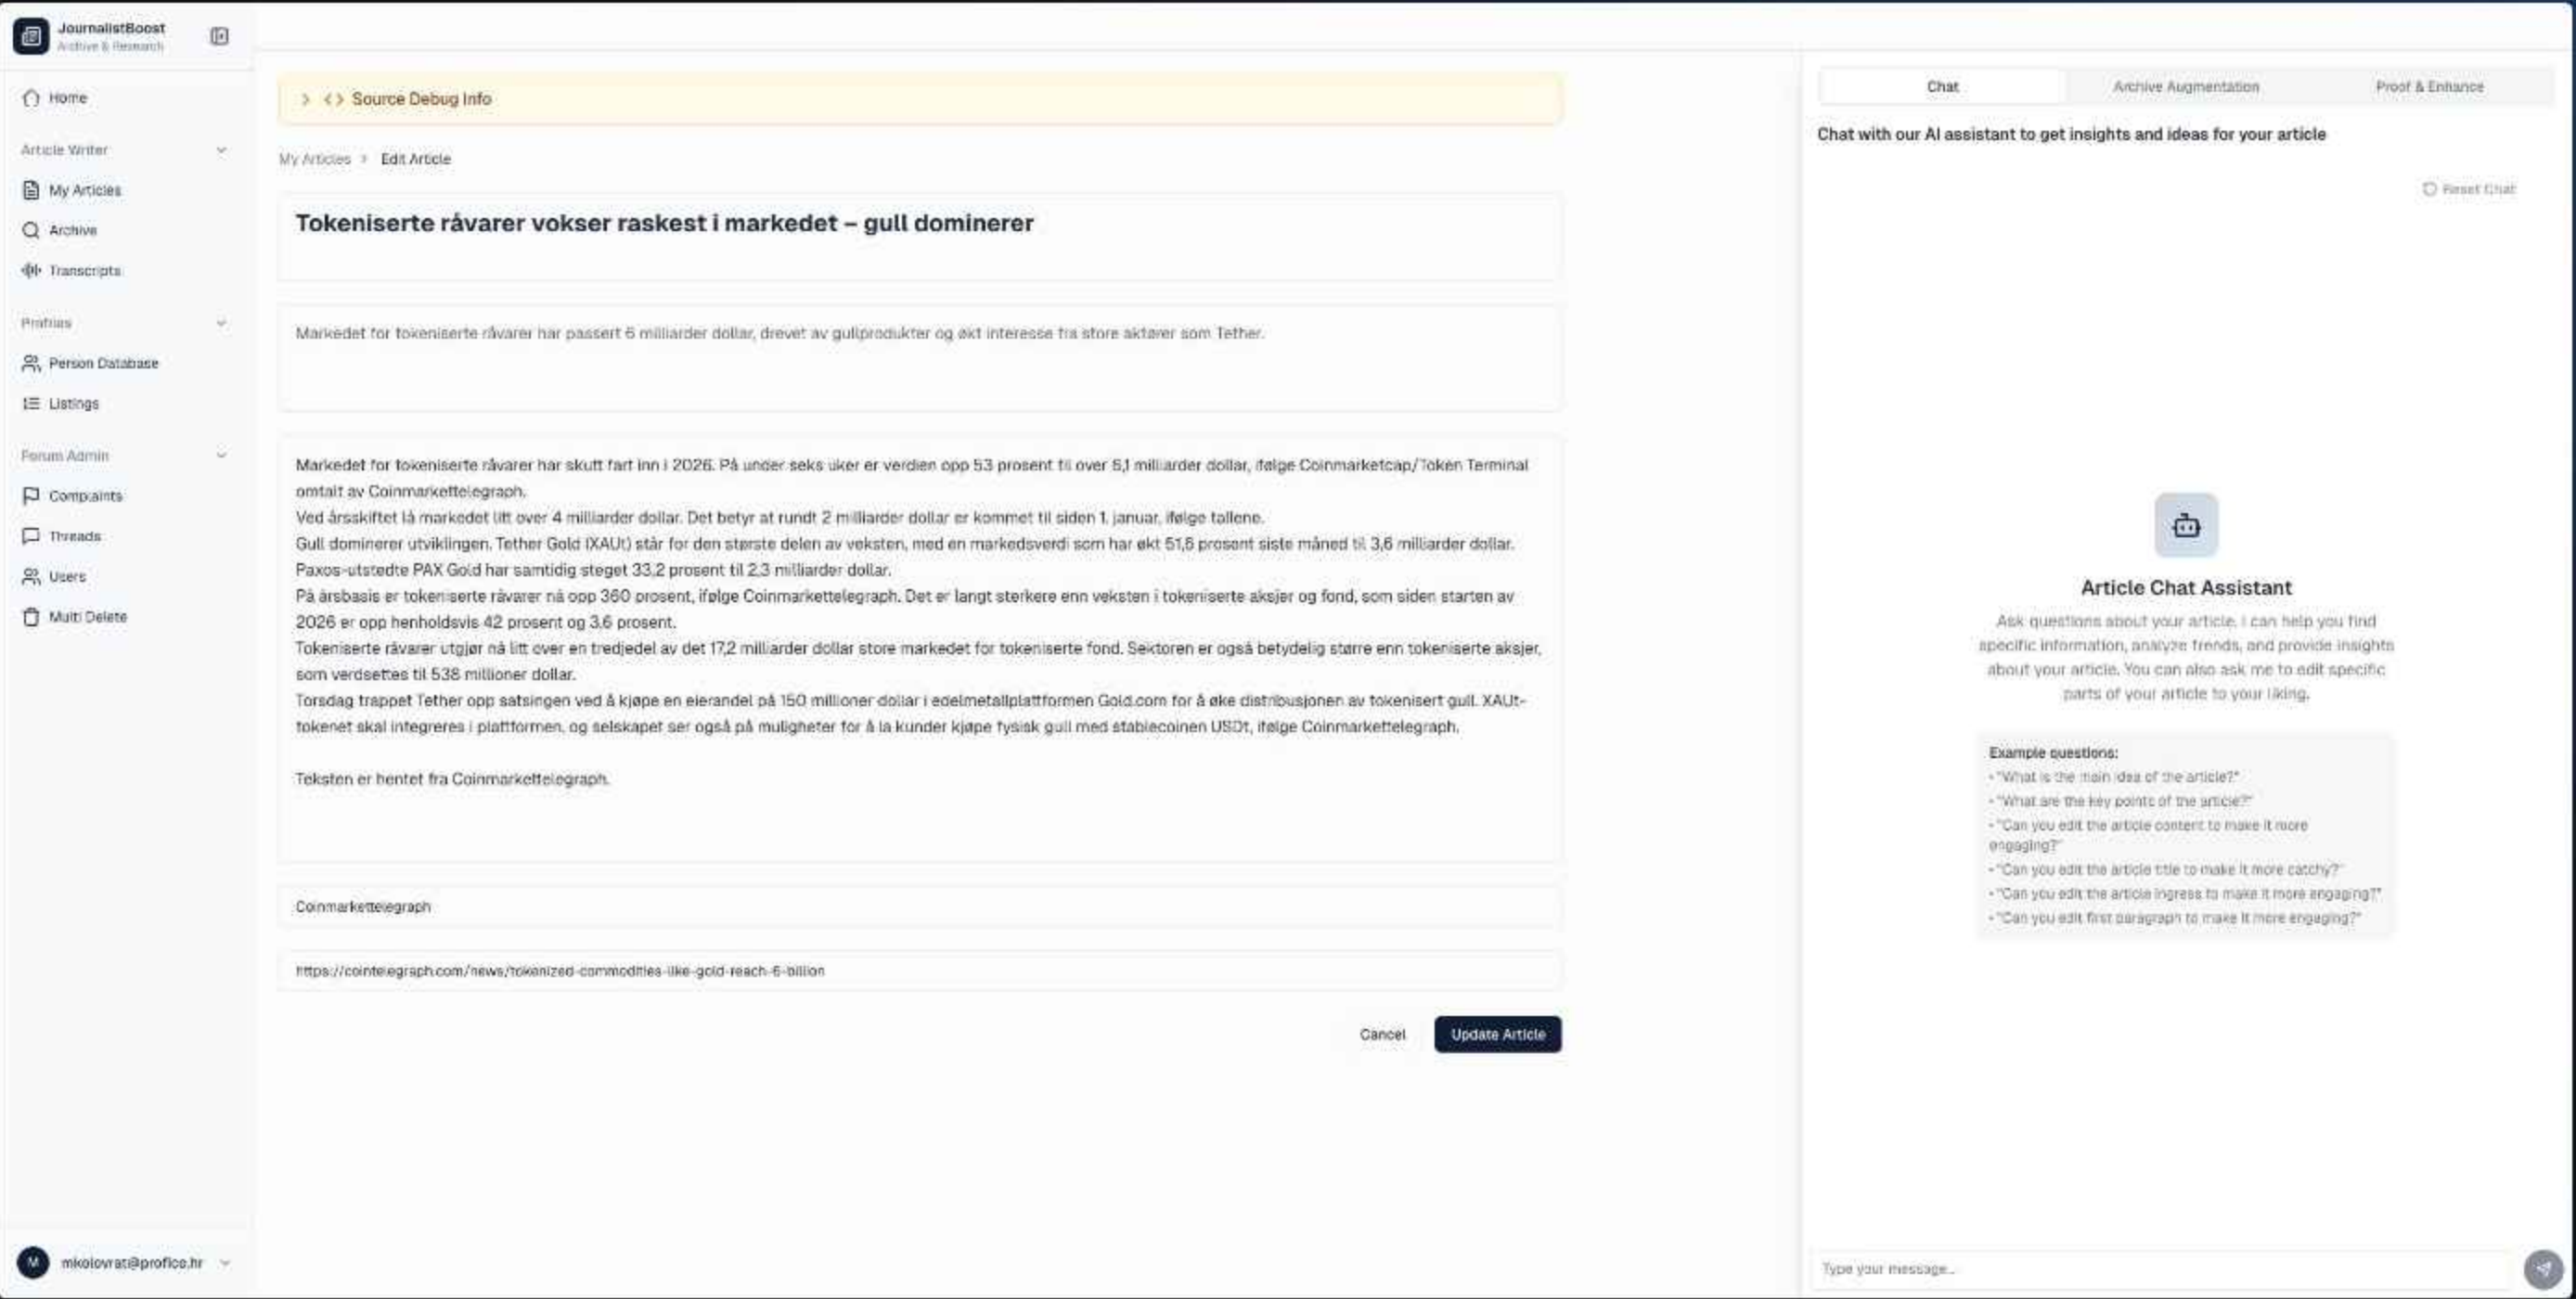

Faster article production through smarter archive searches

Journalists often struggled to find the right context in old archives because search results weren't accurate enough. We vectorized the entire database so the team can now use RAG to pull relevant history in seconds. It has turned a slow, manual research task into a quick and reliable part of their daily writing routine.

Automating editorial standards for faster news production

Turning raw notes or drafts into a finished story used to be a time-consuming manual task for the editorial team. We built an AI writing agent that instantly rewrites incoming text into a polished news article while strictly following internal style and formatting rules.

AI-driven wine discovery platform & wine stock management

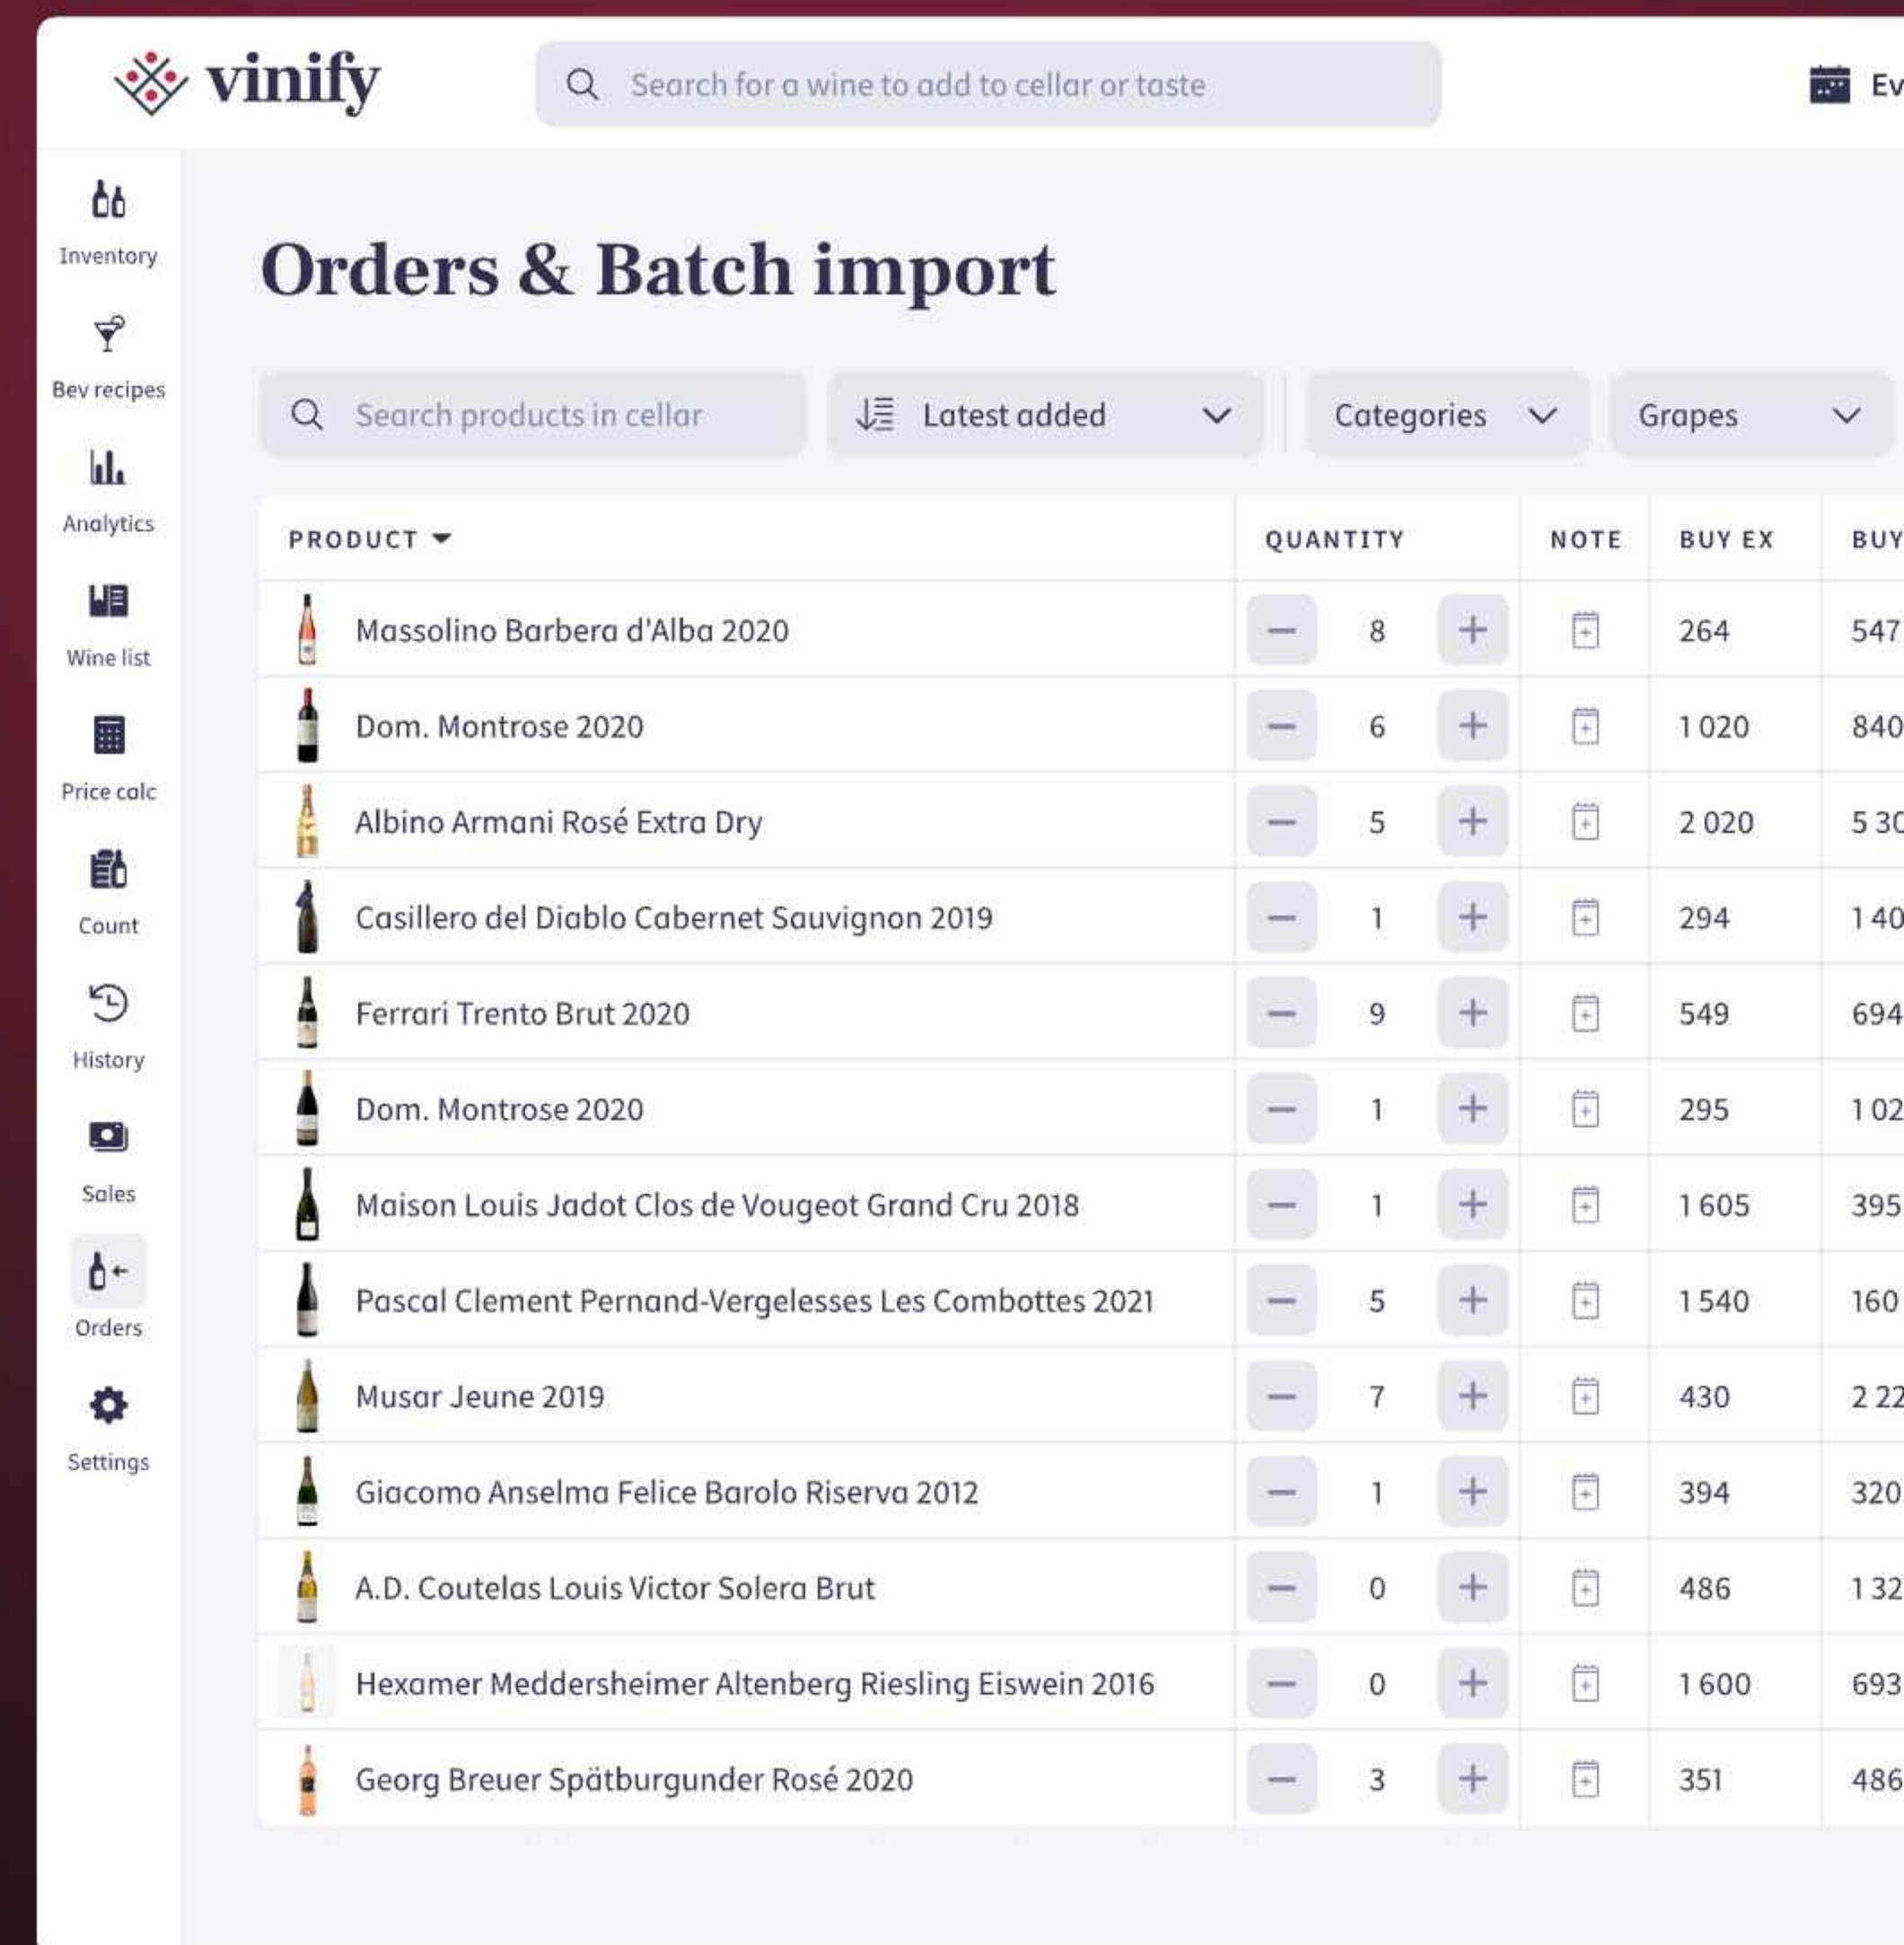

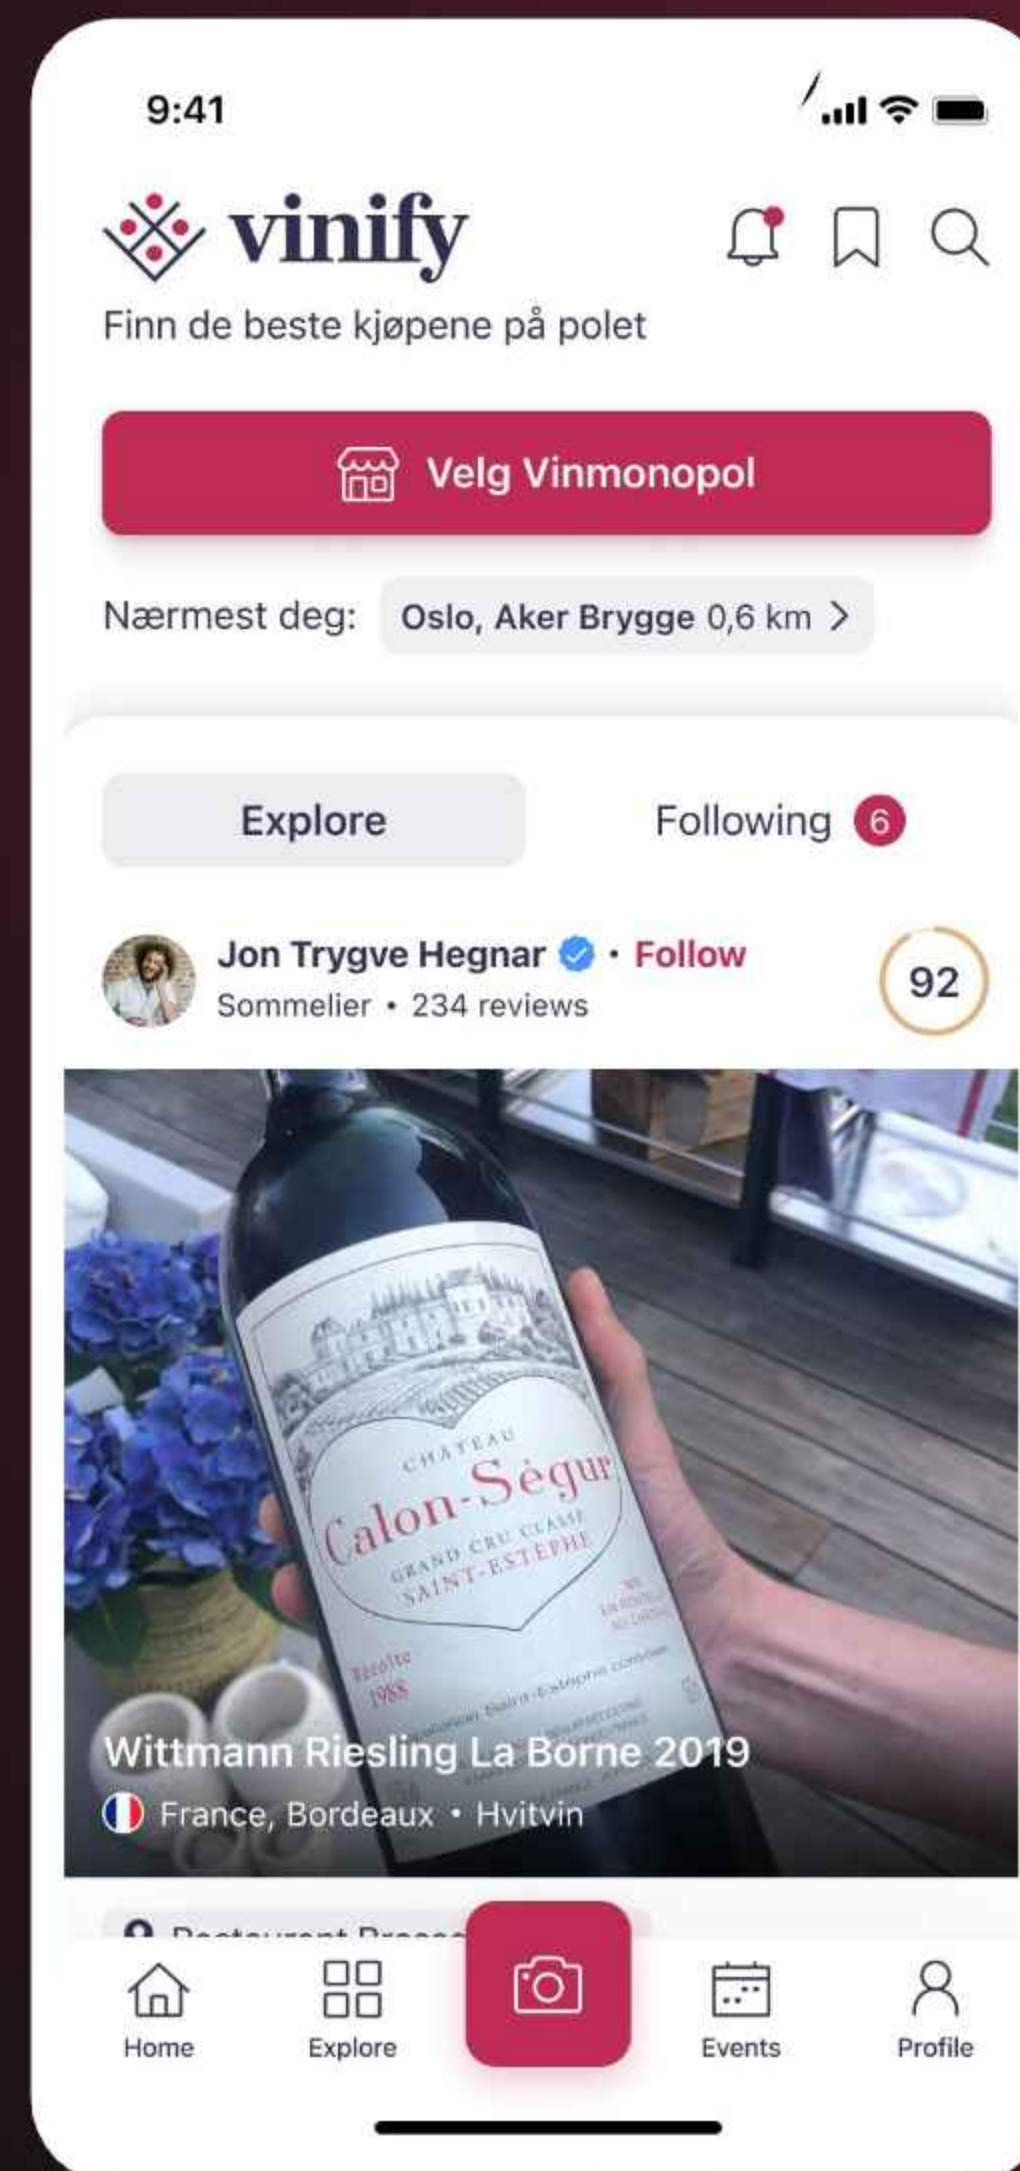

We've been a technical partner for this Norwegian startup since day one, handling design and development efforts of their online platform.

AI-powered private media sharing platform

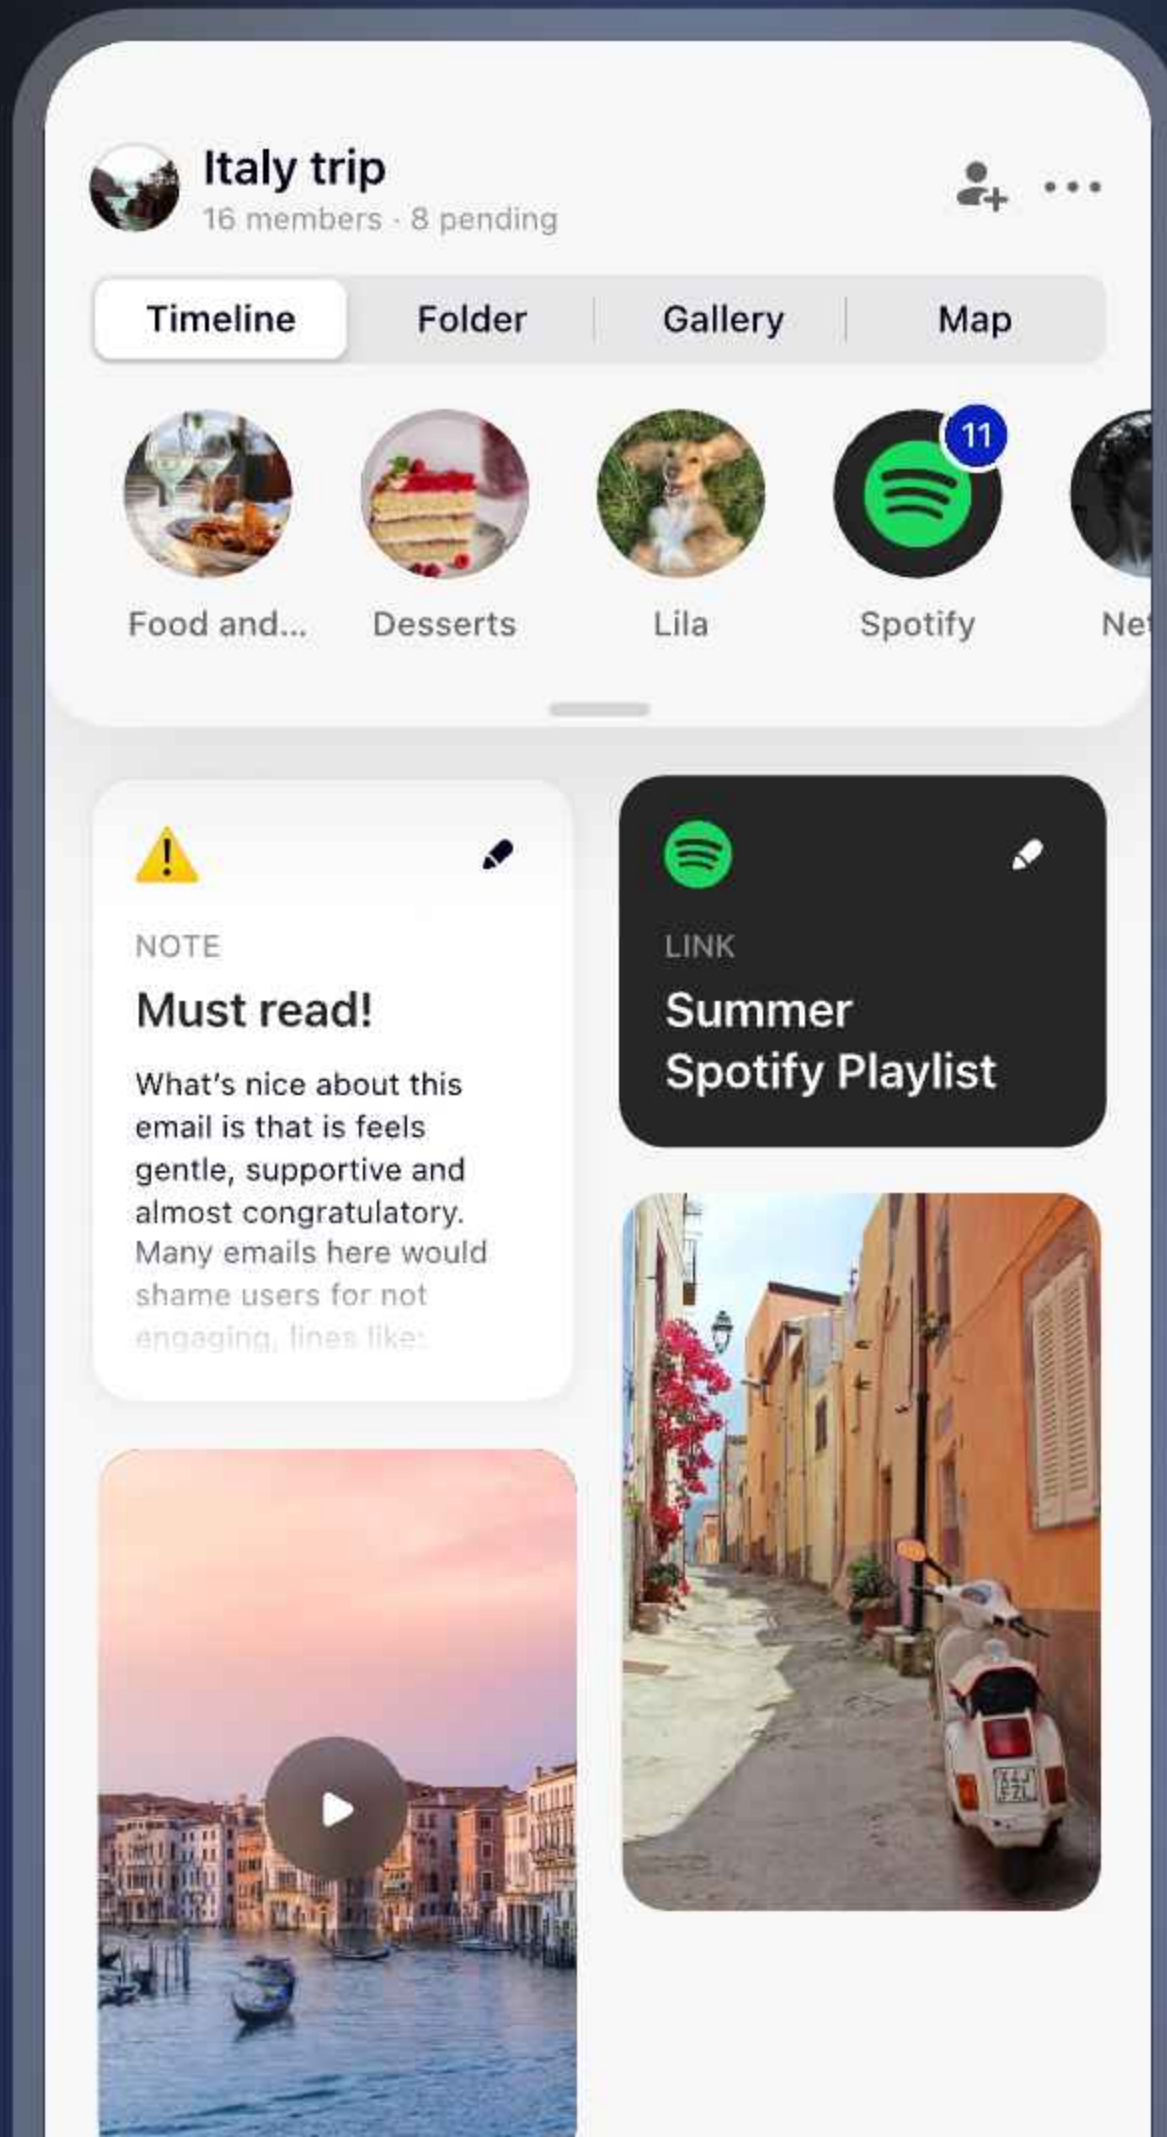

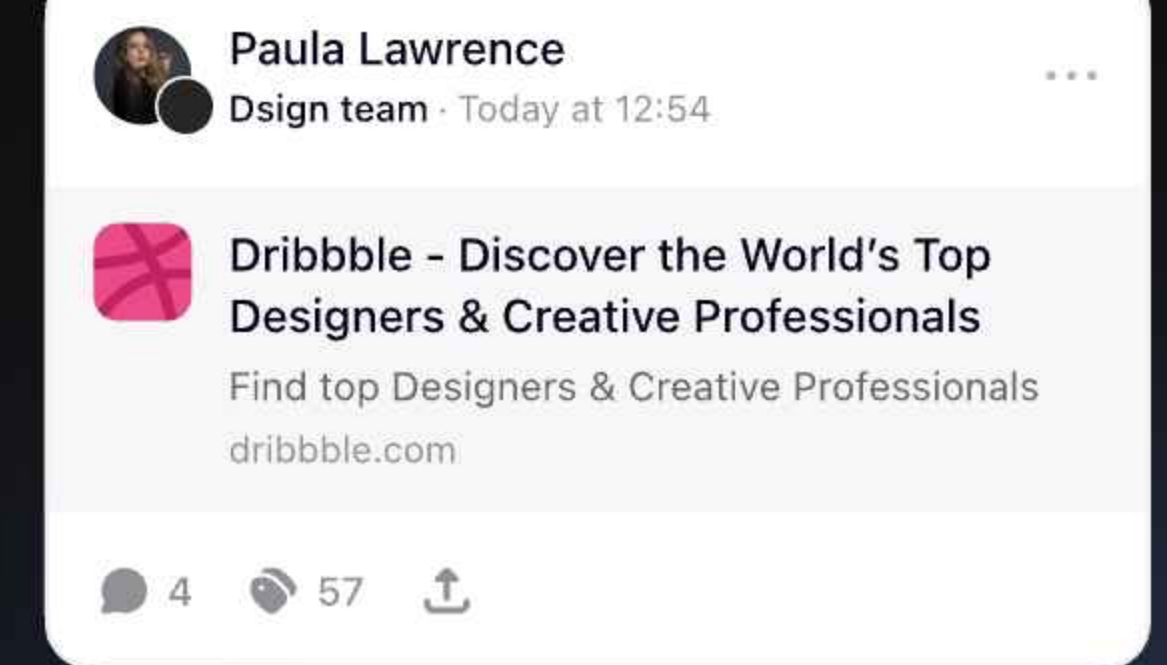

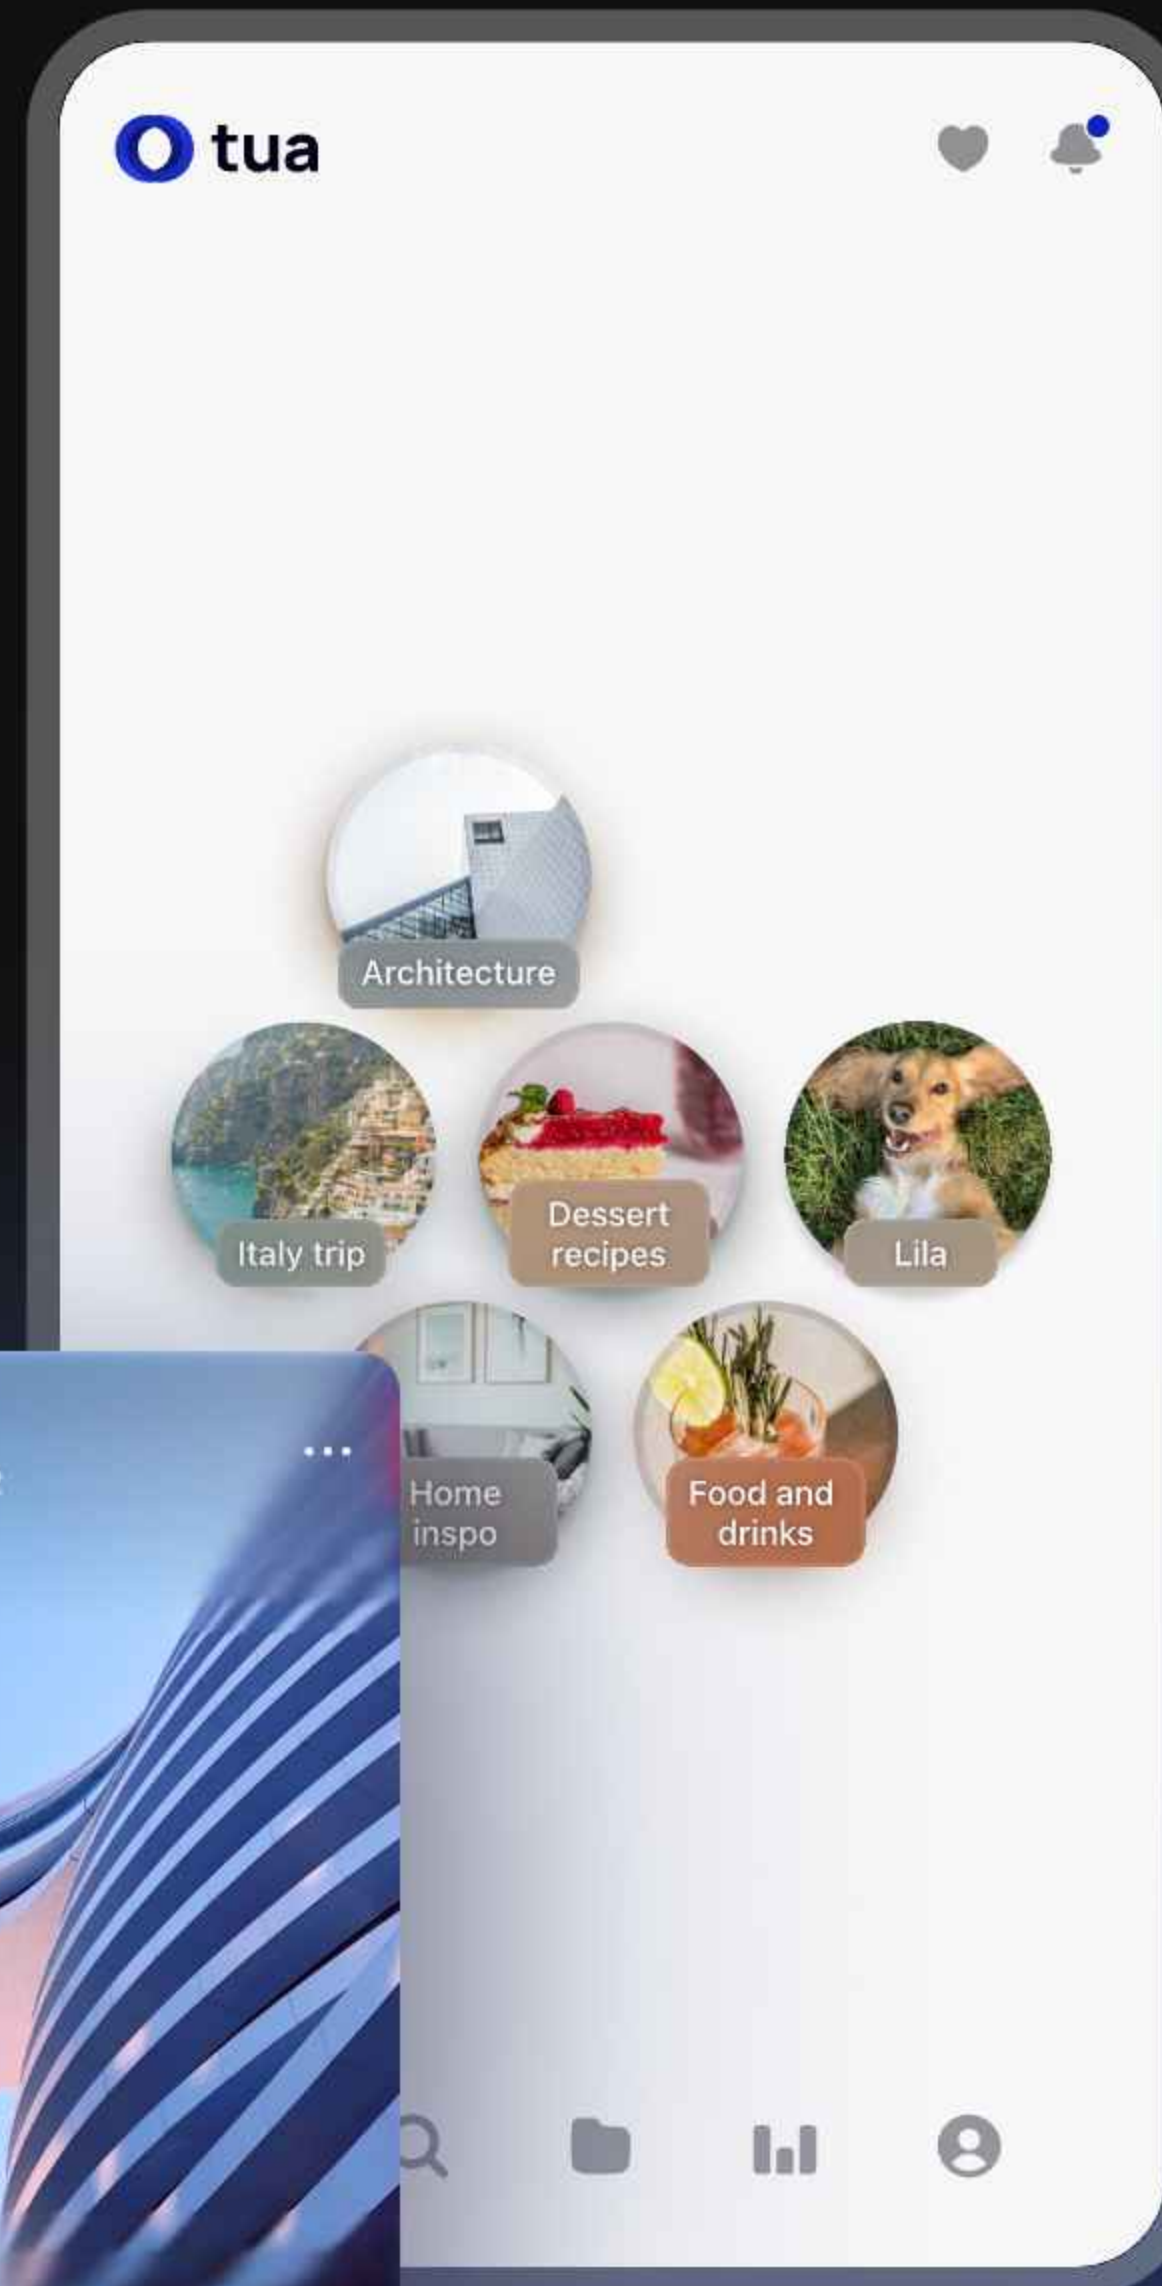

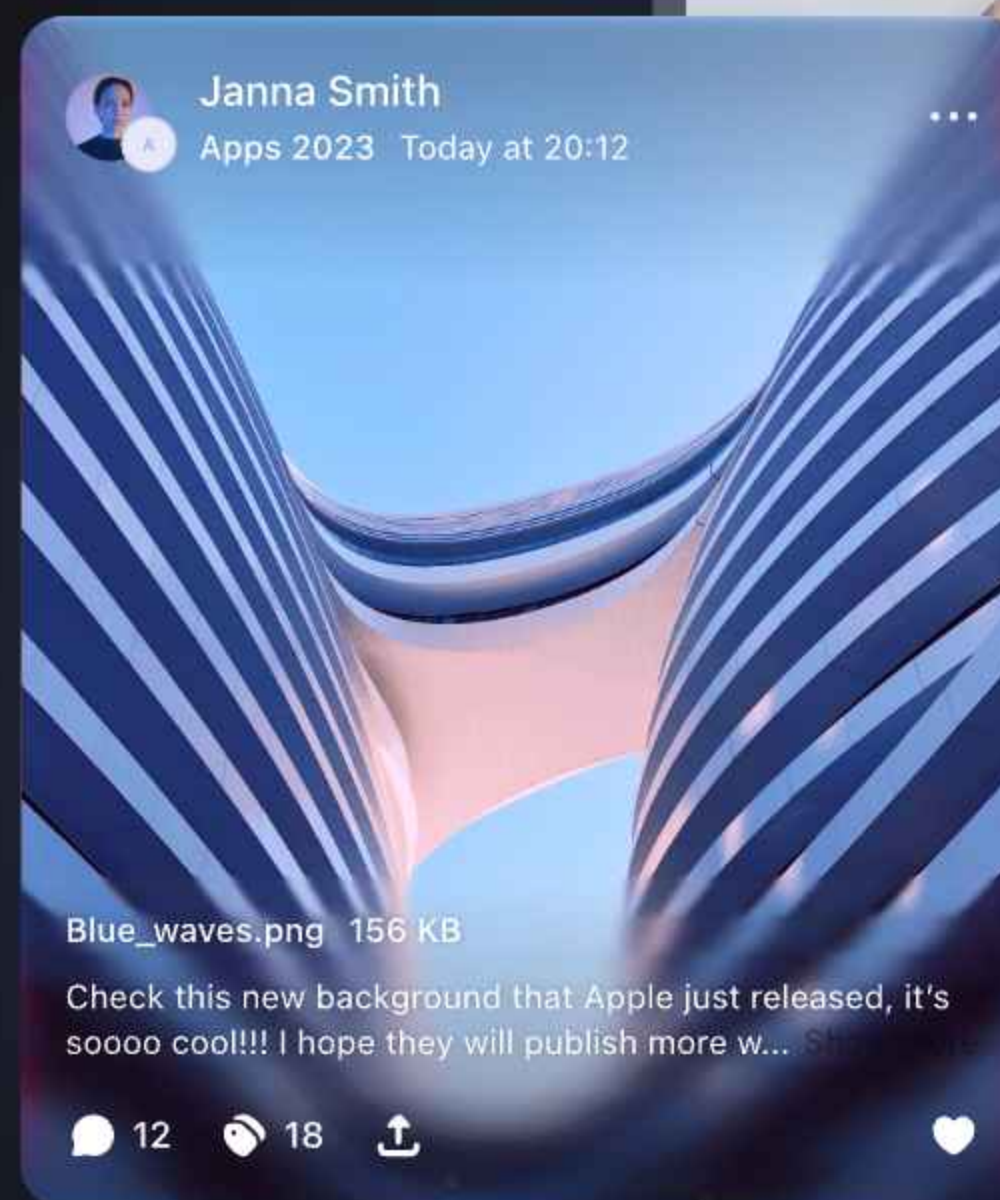

In partnership with Tua, Norway, we've built mobile and desktop platforms focused on private and secure file sharing. To address a gap in their knowledge management system, we implemented a RAG-based search that reads full document content, enabling users to find information based on meaning rather than just titles or metadata.

INDUSTRY

Cloud, File storage

ENGAGEMENT

Standalone product team

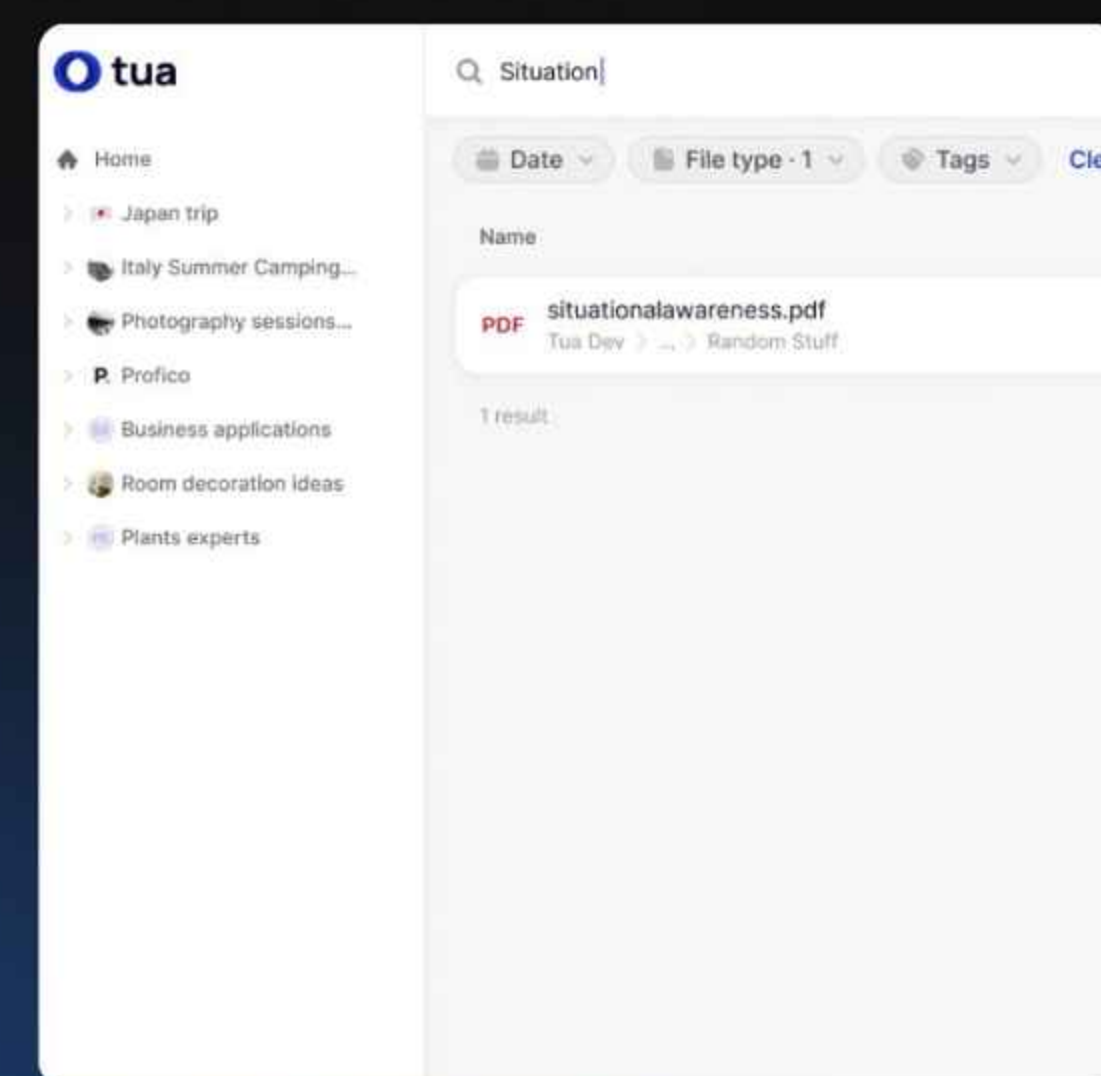

How AI improved file management for Tua?

The AI indexes the actual content of documents and images, allowing users to find what they need using natural language instead of precise file names. This shift removes the reliance on high-quality user input by automatically summarizing and categorizing files the moment they are uploaded.

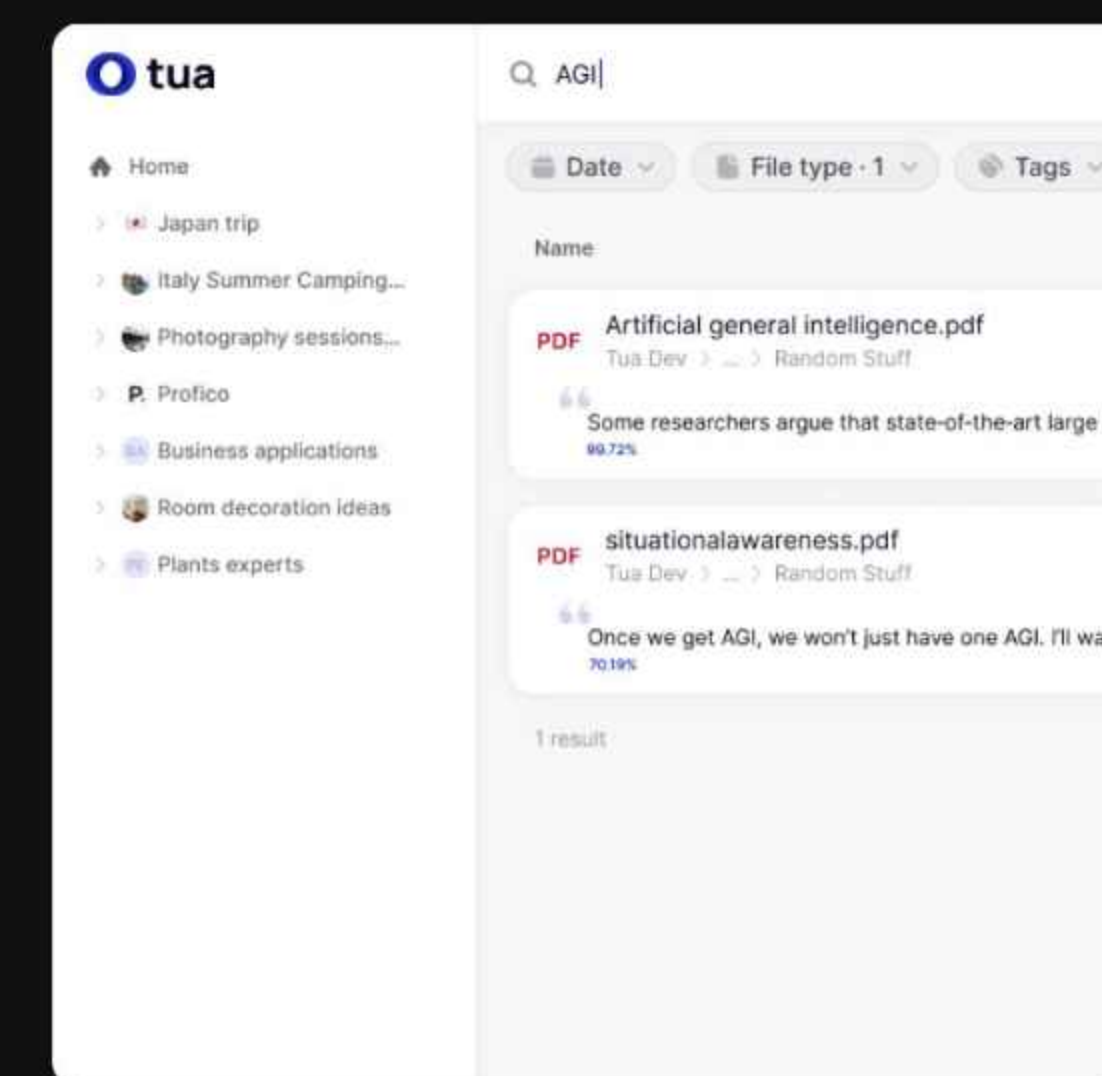

Profico TUA CIRCLES: IMPROVED SEARCH

BEFORE

If search term does not appear in metadata (Name, description or caption) then user won't get any results.

AFTER

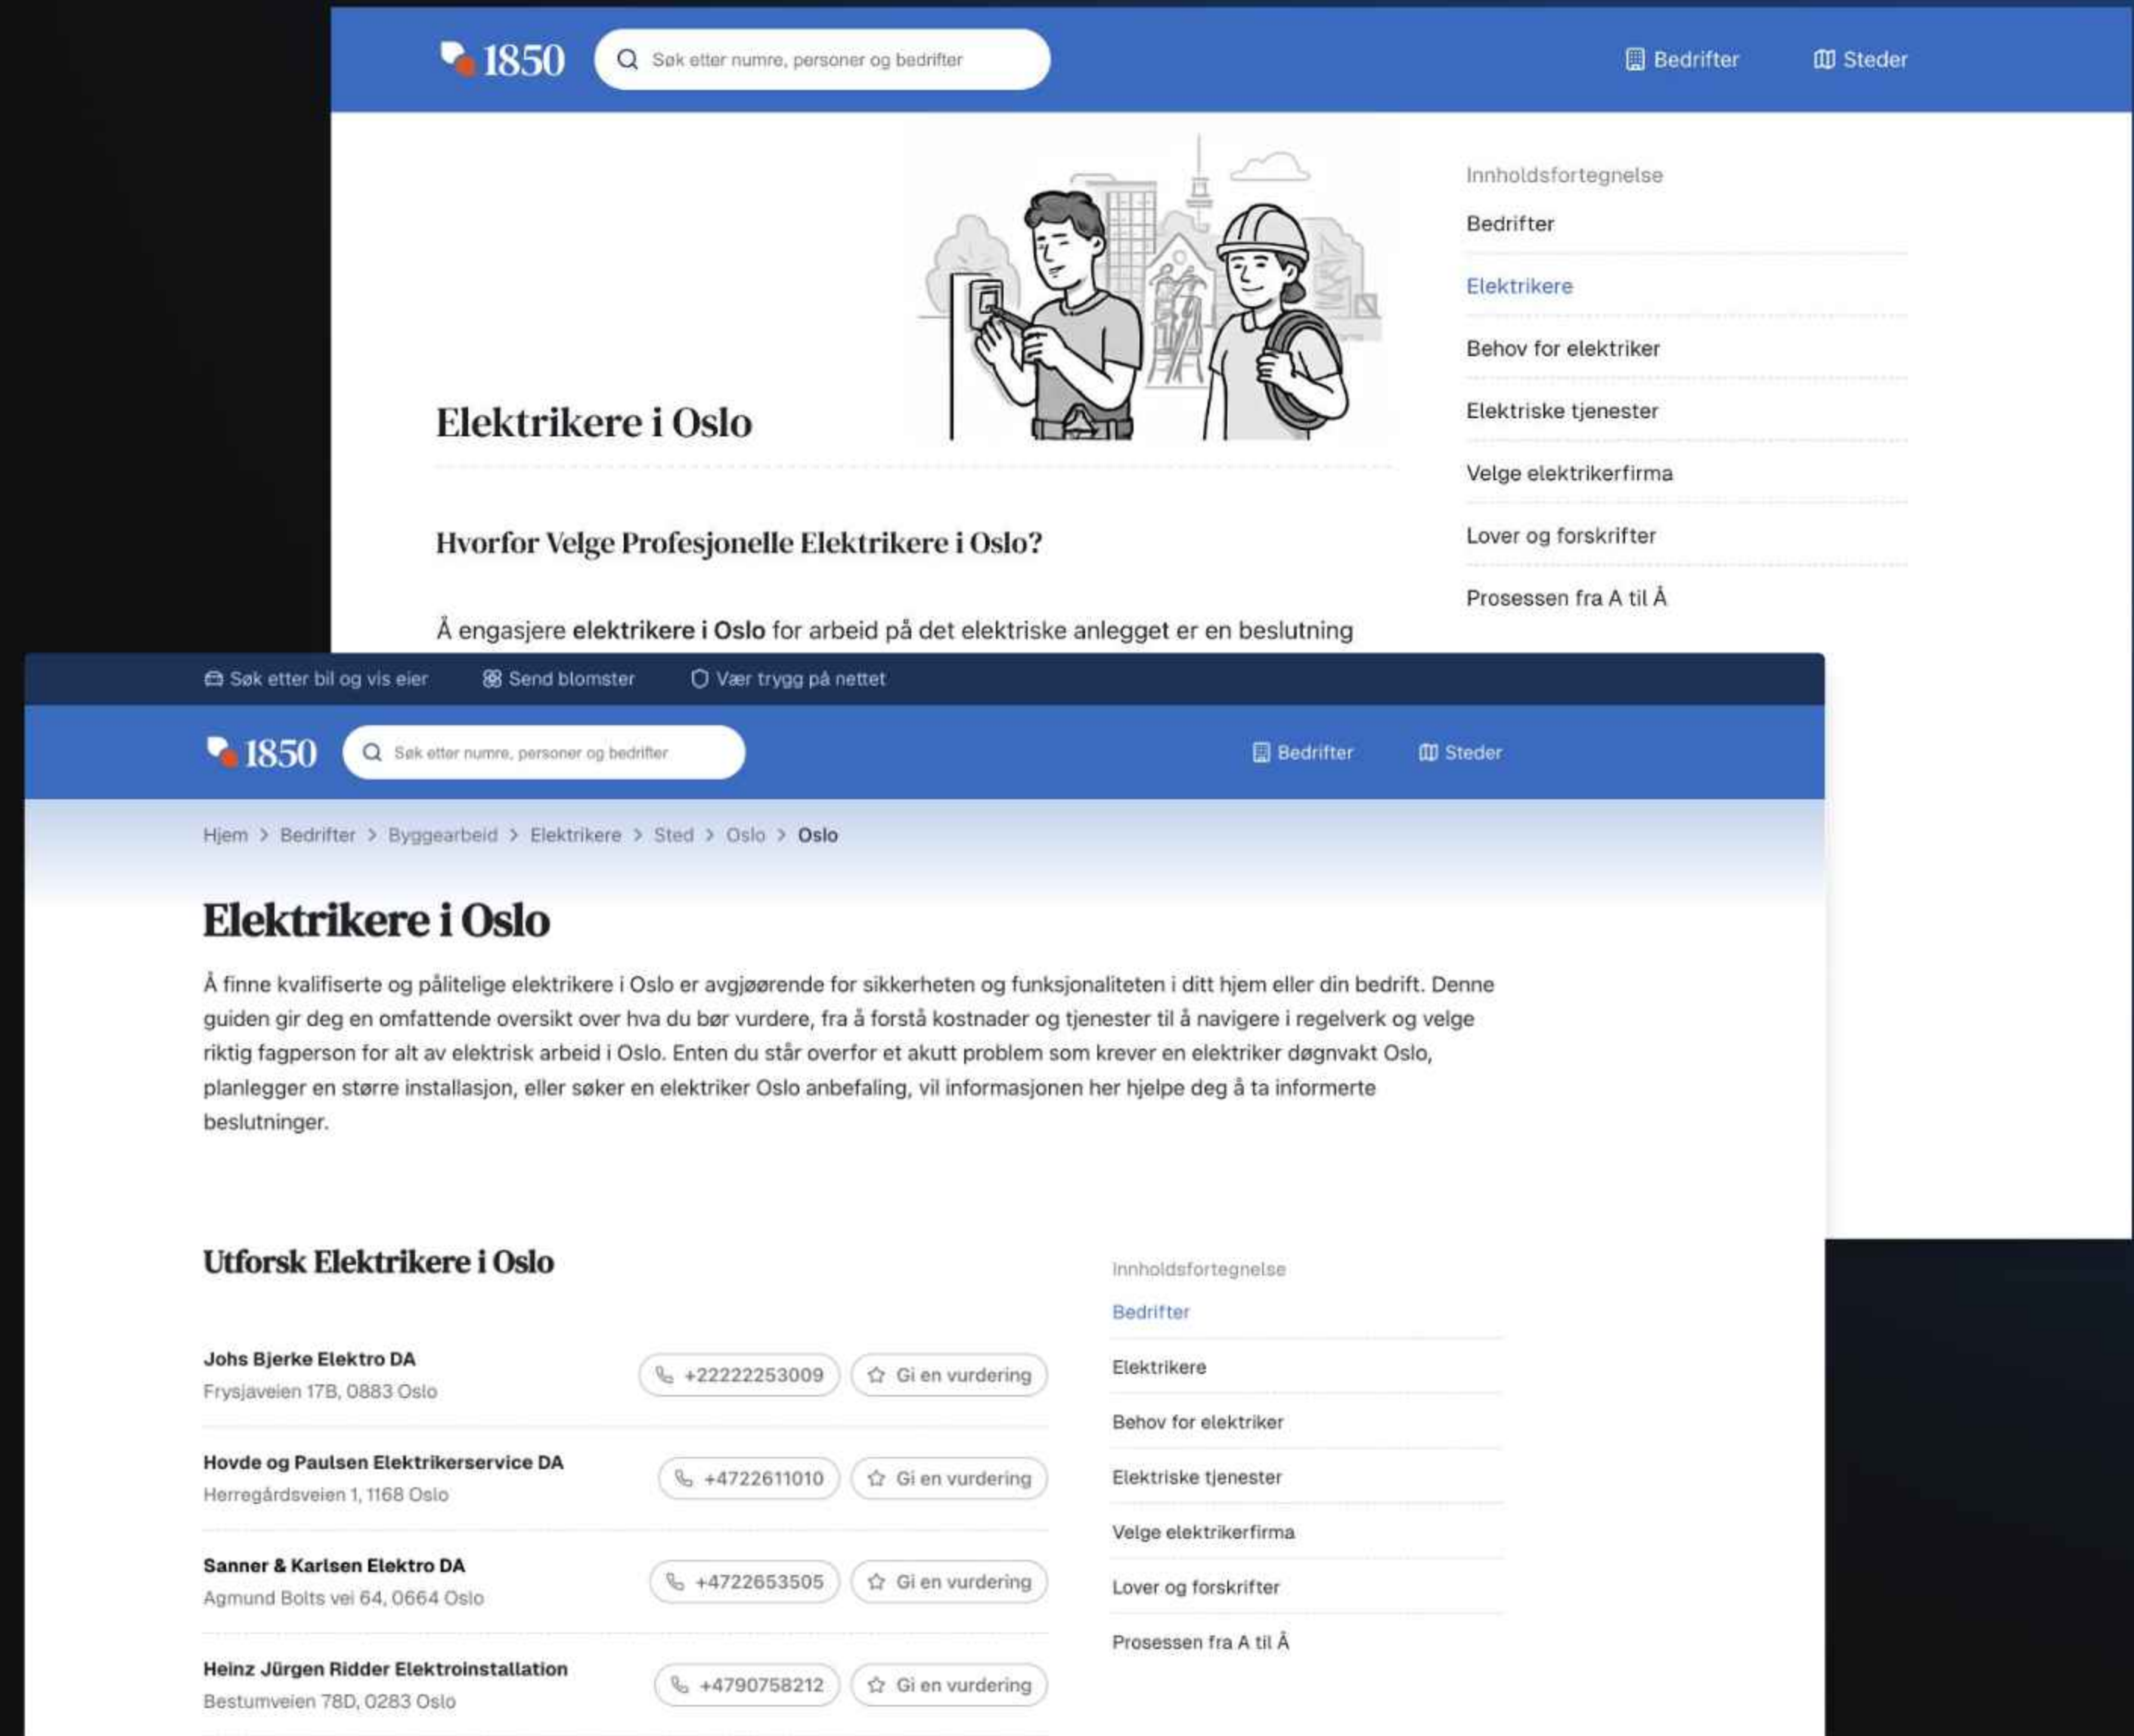

Searches across documents and determines the significance factor (%)

Multi-agent setup for content generation and optimisation

For 1850.no, a Norwegian digital directory, we were tasked with scaling their content production to cover thousands of unique service and location combinations.

As a result we built a fully automated content pipeline that transforms simple category and location inputs into complete, SEO-optimized articles with images and FAQs, enabling the production of thousands of unique pages without manual intervention.

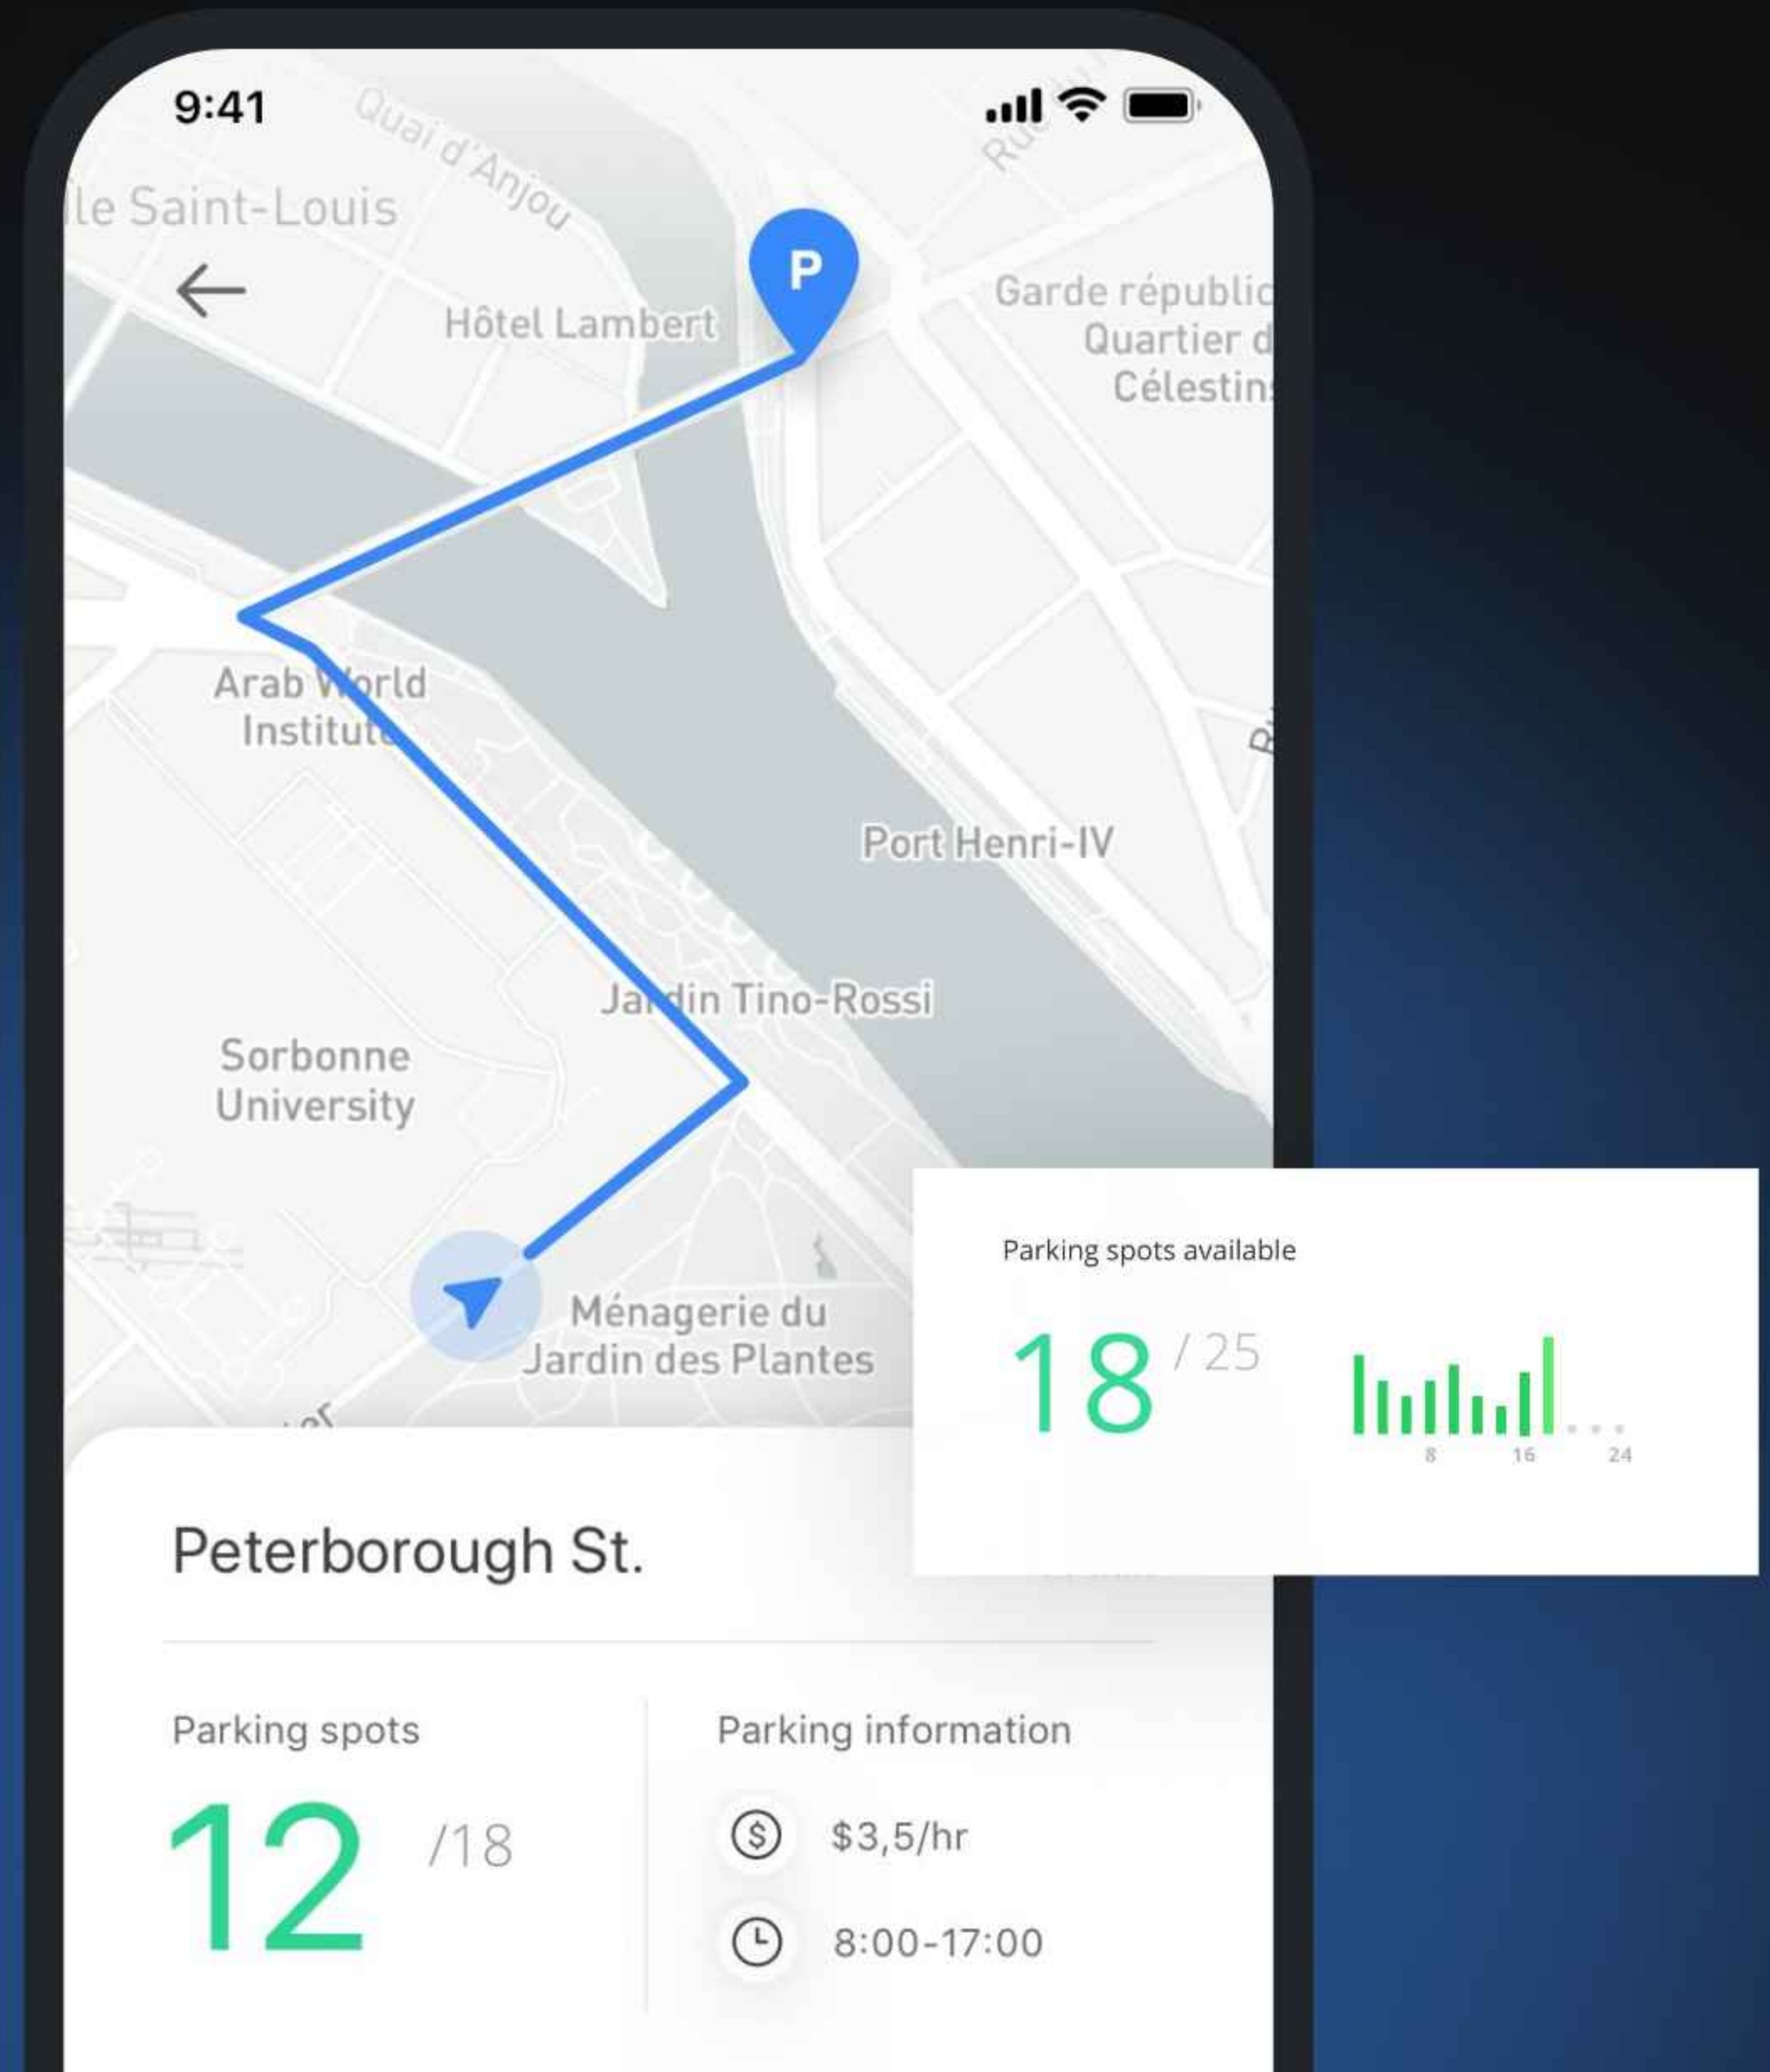

City Scale Smart Parking System – mastering urban movement with AI

Award winning parking management, navigation and payment platform for smart cities of tomorrow. Built over a network of 10,000+ NBloT sensors and deployed in 5 European cities. Evolving into an active urban planning tool that predicts availability for drivers and forecasts occupancy for operators, the platform is powered by a robust suite of features:

- INTELLIGENT DRIVER ROUTINES
- VOICE-TO-DATA INTERFACE
- OCCUPANCY INTELLIGENCE & PLANNING
- SMART SUPPORT FOR FIELD OFFICERS

AI-POWERED DISCOVERY WORKSHOP →

Automating class location monitoring for oil and gas pipeline operators with Agentic AI

THE CHALLENGE

Existing change-detection models

Existing monitoring technology can detect and assess changes along the pipeline, but imagery alone cannot always tell operators what a detected change represents or how long it is likely to remain.

70%

THE CHALLENGE

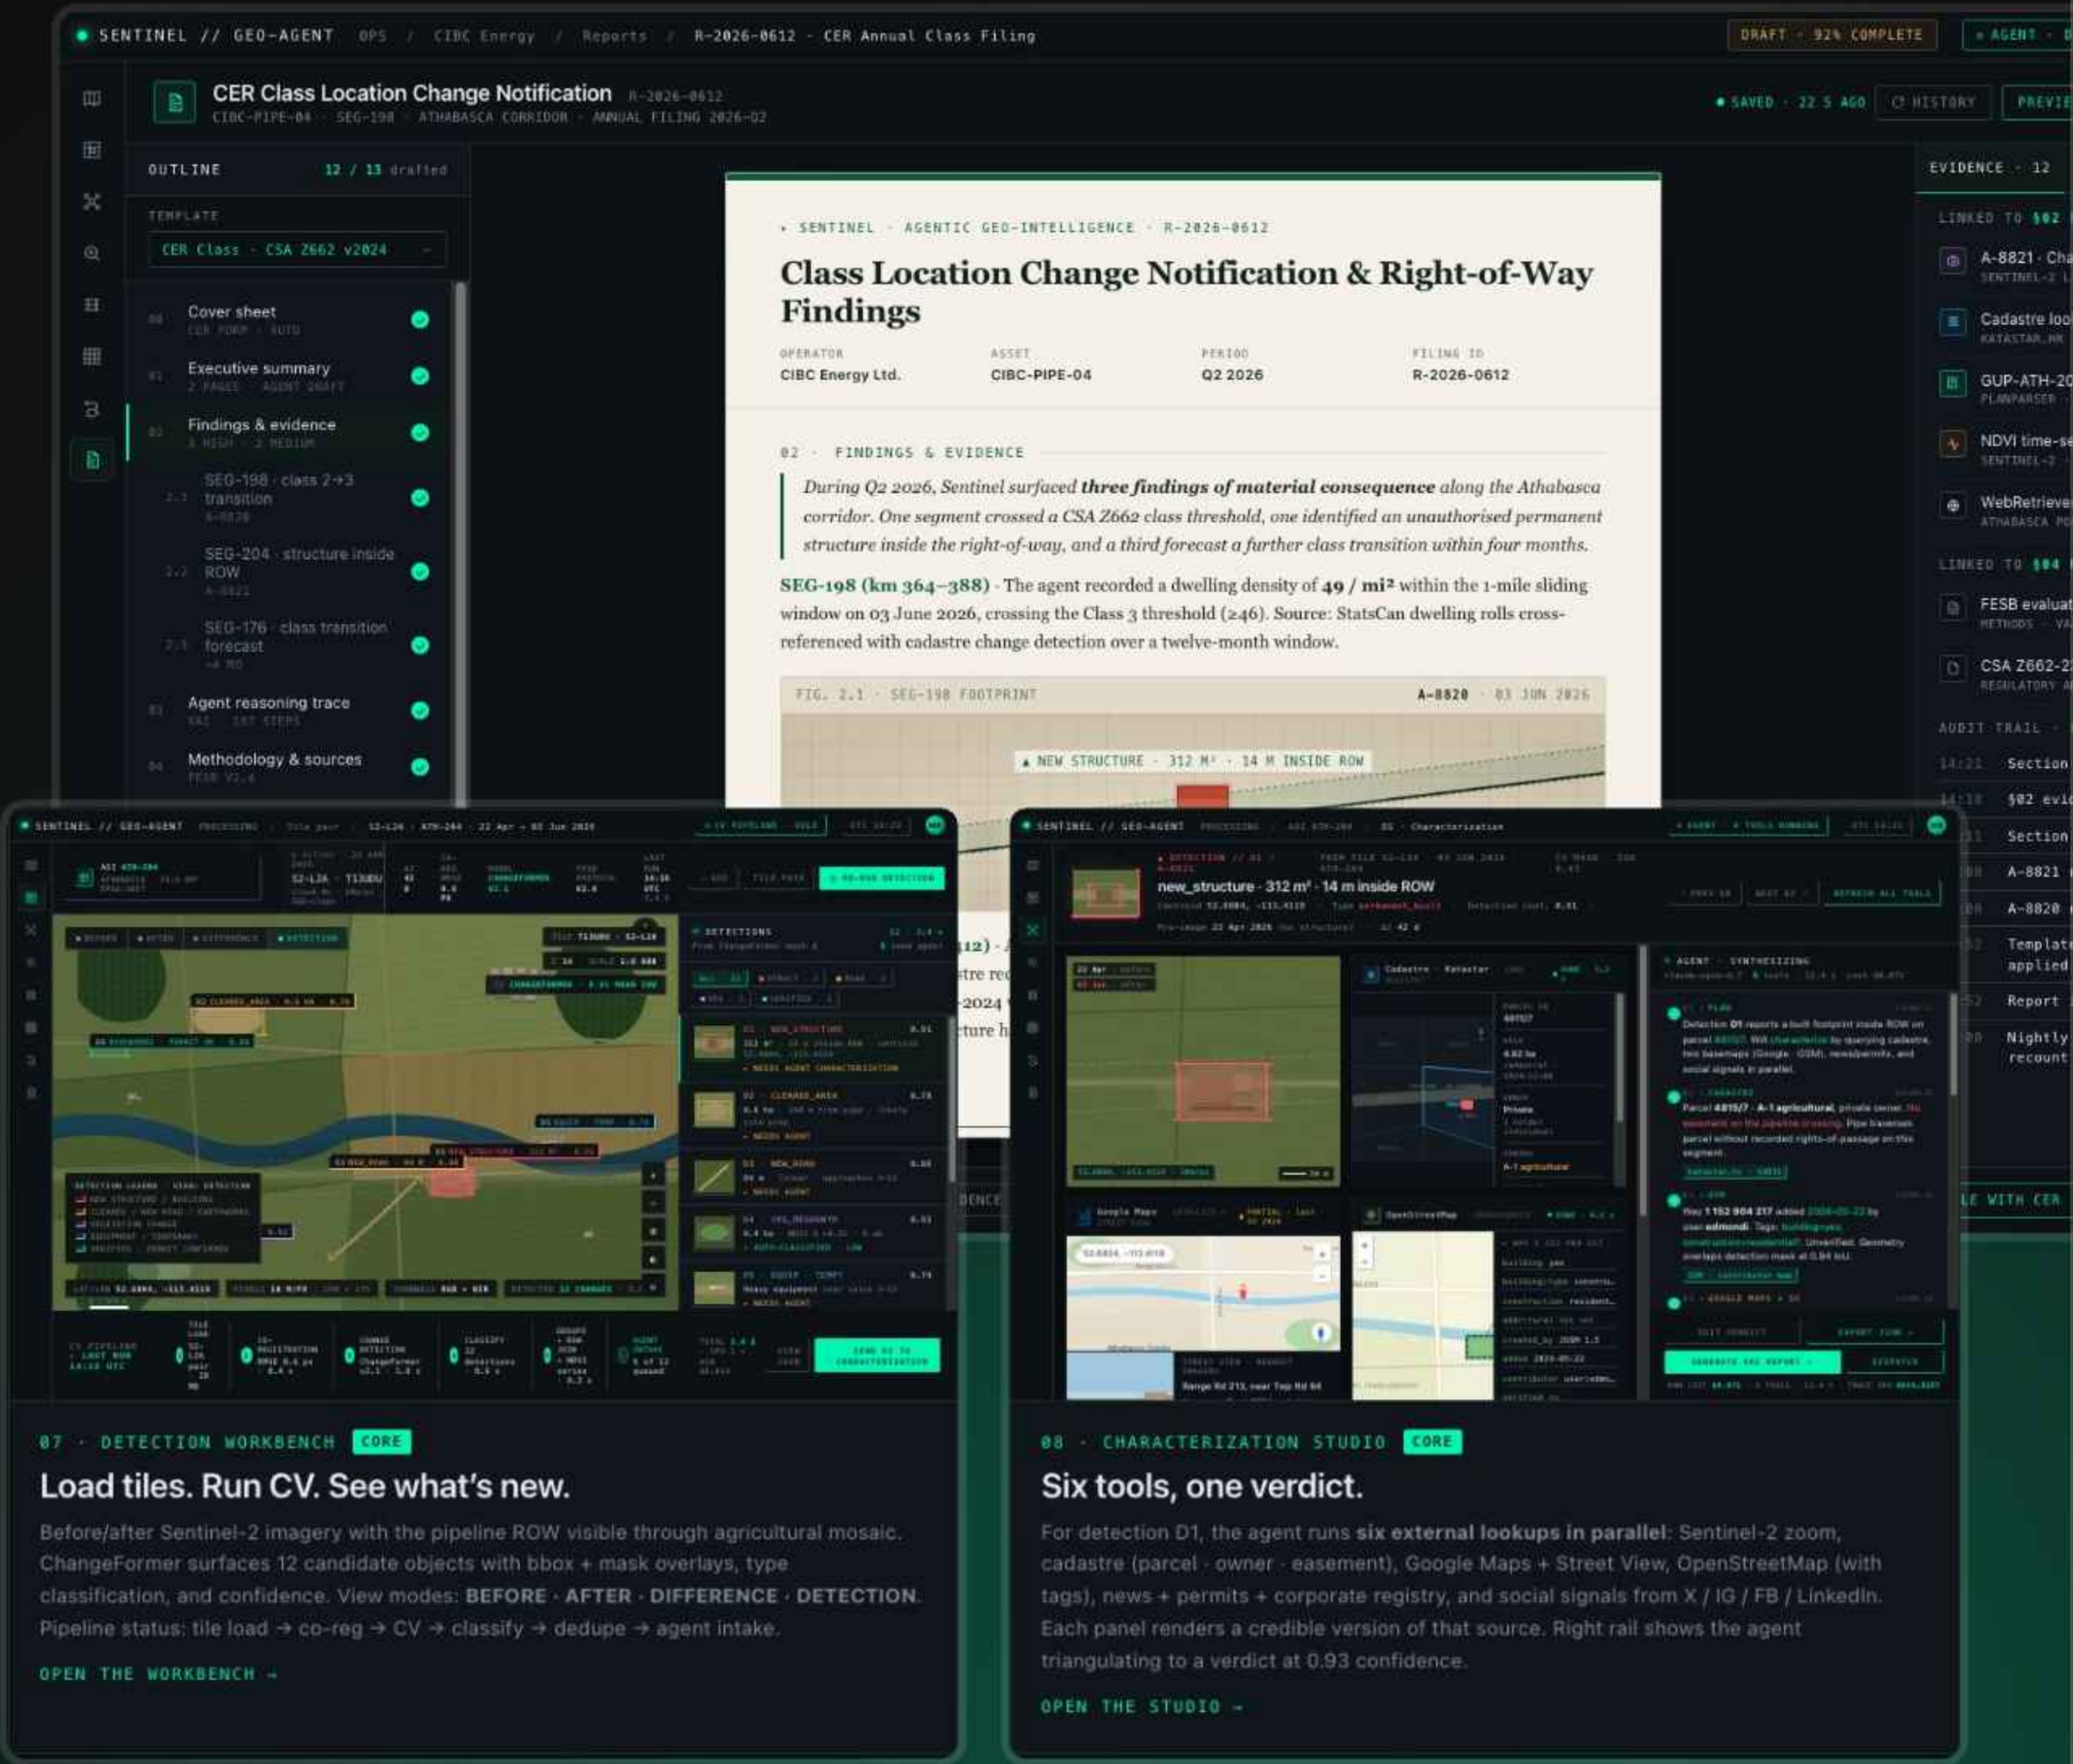

Change detection + AI context layer

Implementing an agentic AI layer that will be able to investigate detected changes by connecting them with external evidence, helping operators establish what those changes represent and how they could affect the pipeline.

Agent-based AI for staying ahead of every risk along a pipeline

Our solution in development adds an agentic AI layer to the existing class location monitoring process. The agents can investigate detected changes using available external sources, follow how those changes could affect class location, and turn the resulting evidence into information operators can review and use in their reporting. This allows the system to support more of the work that happens between detecting a change and deciding how to respond to it.

Corridor Change Detector

Automating image comparison

Corridor Change Detector compares new corridor imagery with the existing baseline, then uses AI to identify the specific change at each location, whether that is cleared land, roadworks, heavy equipment, or a new foundation. Each change is classified, located, and prioritized so operators can focus on developments that may require further assessment.

Class Transition Tracker

Monitoring safety reclassification

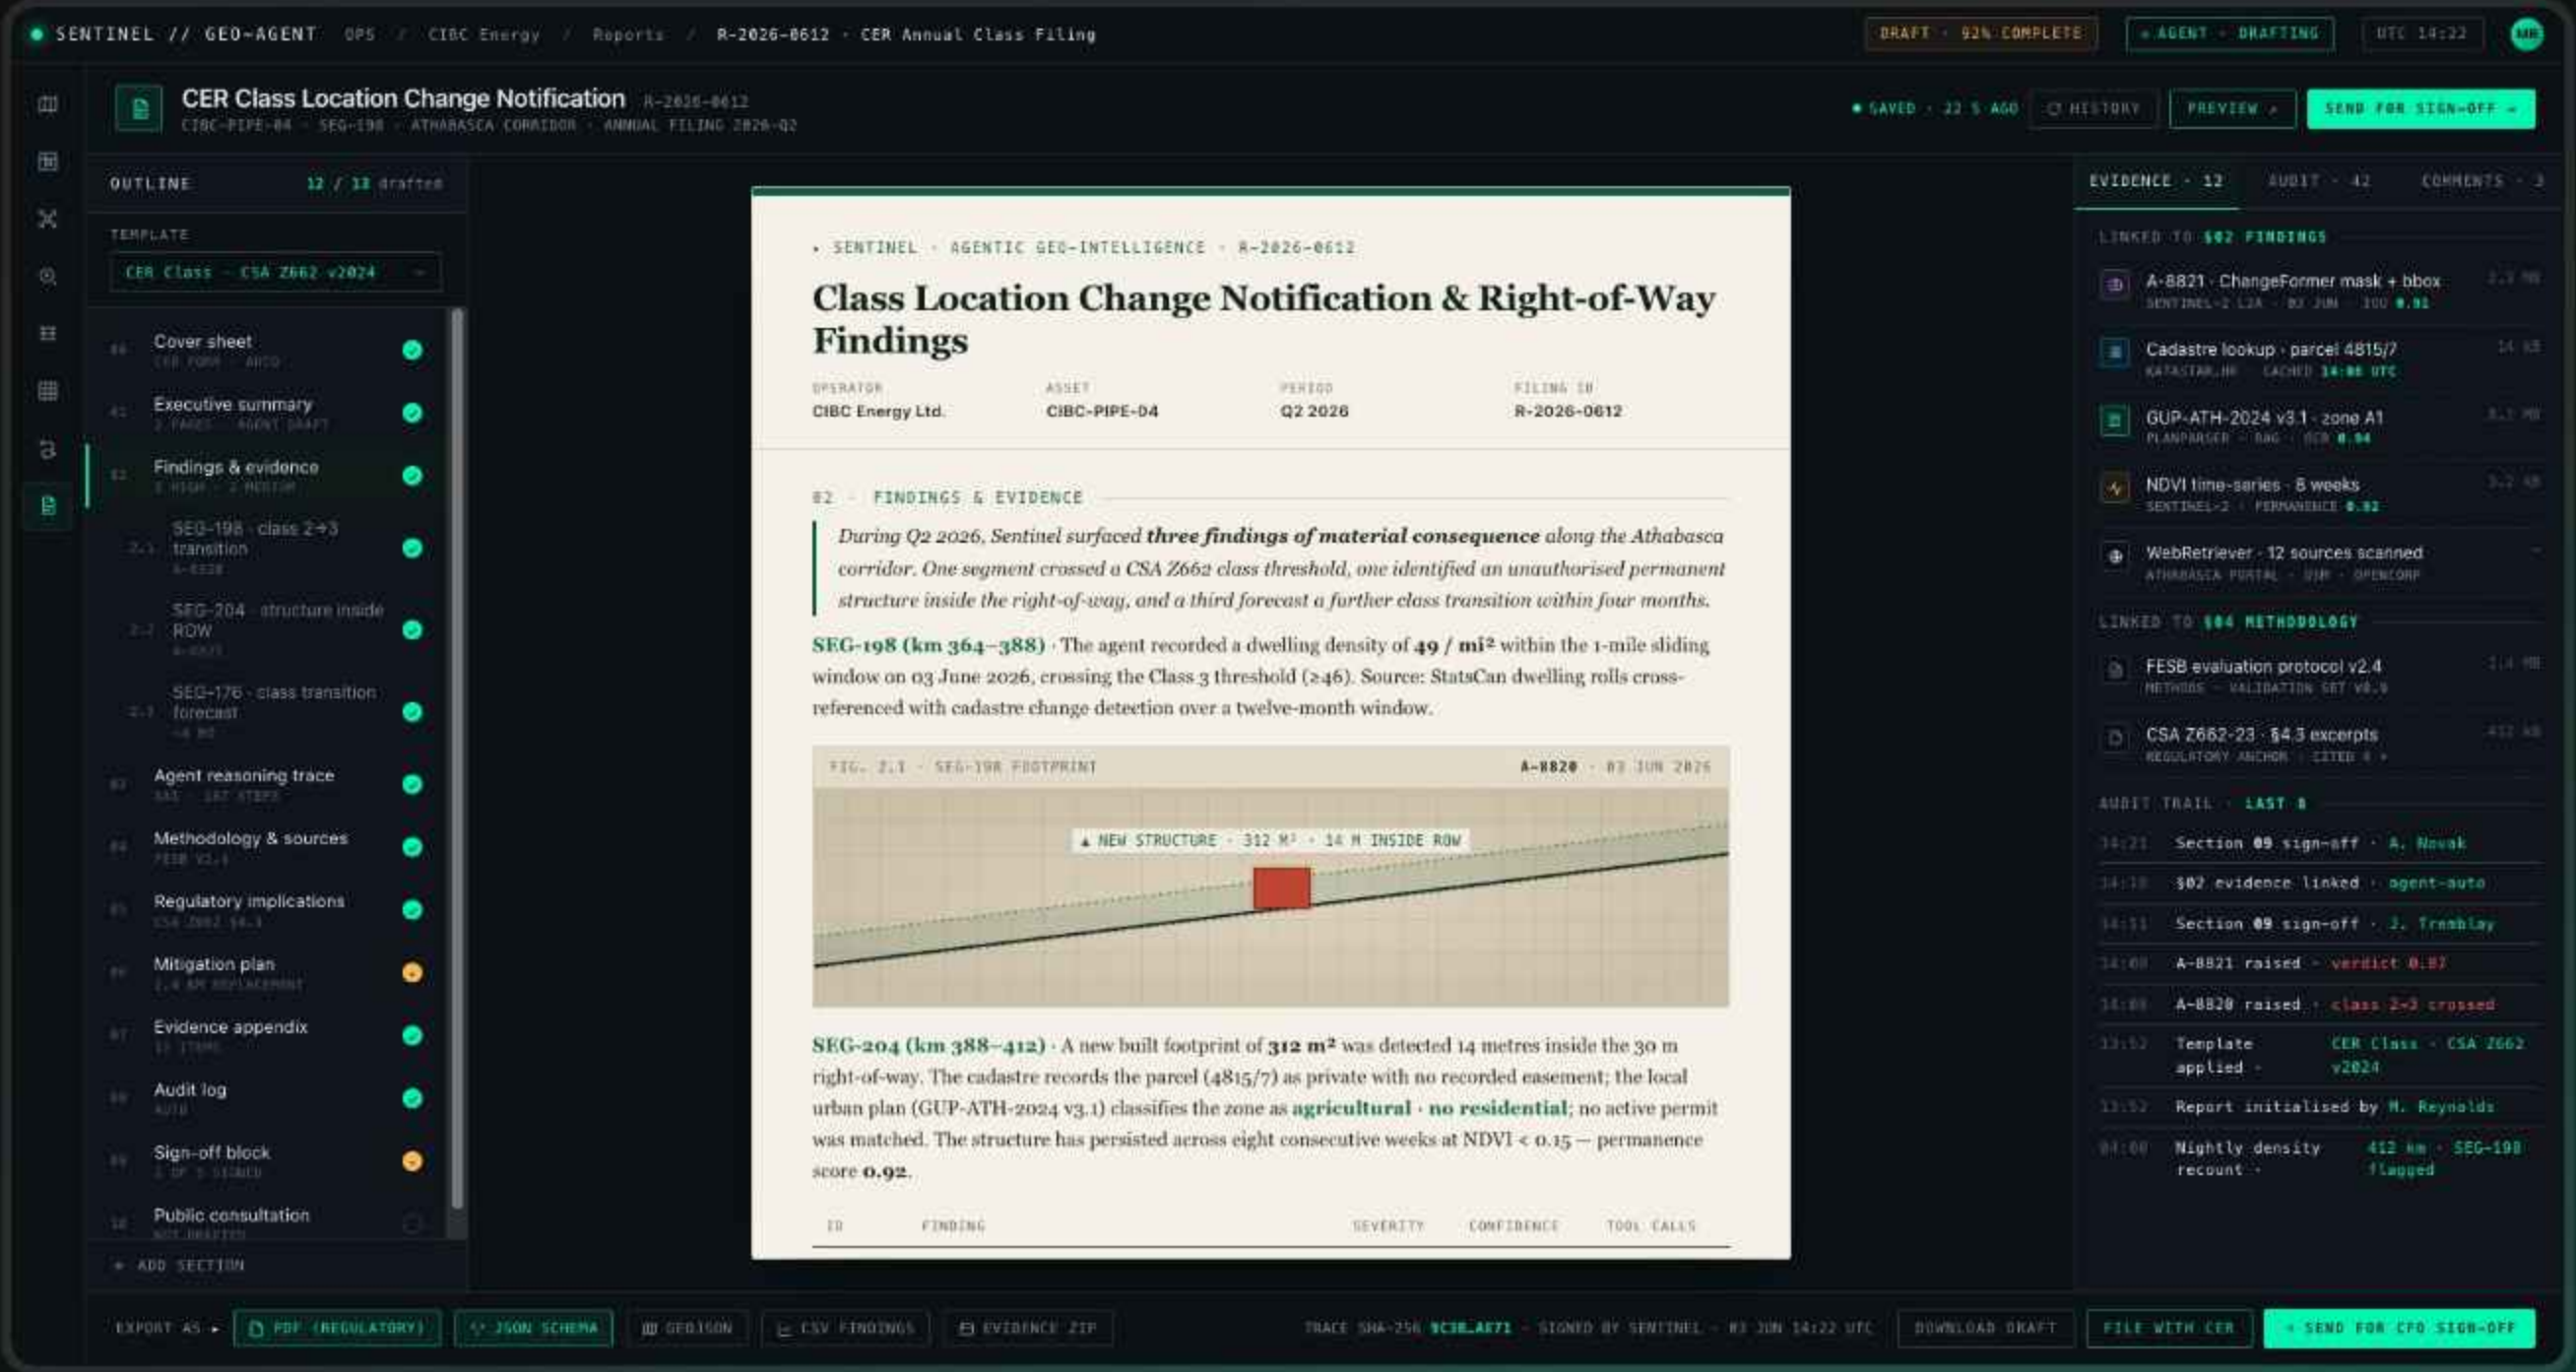

Class Transition Tracker leverages AI to keep evaluating how newly detected structures affect the sliding-mile calculation along the pipeline. As development changes the structure count, it identifies segments moving toward a higher class location and shows operators which new structures are driving that transition.

Regulatory Report Generator

Automating a compliance report

Regulatory Report Generator carries the evidence gathered during the assessment into the reporting process. It can organize maps, property records, calculations, source references, and audit trails into a defined report template and draft the supporting narrative, so compliance teams can review a documented case instead of assembling it manually from separate sources.
